L2 *Announce “Is there any EOD personnel on board ?”. By using the initials, only persons familiar with EOD (Explosive Ordnance Disposal) will be made aware of the problem.*

L1 DO NOT OPEN THE BOMB
DO NOT CUT BOMB’S WIRES
SECURE BOMB AGAINST SLIPPING
PROTECT BOMB AGAINST SHOCKS

L2 *Secure in the attitude found and do not lift before having checked for an anti-lift ignition device.*

L1 PASSENGERS..........LEAD AWAY FROM BOMB

L2 *Move passengers at least 4 seat rows away from the bomb location. On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*
Passengers near the bomb should protect their heads with pillows, blankets.
All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables should be in their full upright position.
Service items may need to be collected in order to secure tray tables.

L1 PORTABLE ELECTRONIC DEVICES..........SWITCH OFF

L2 *The cabin crews must command passengers to switch off all portable electronic devices.*

L1 BOMB..........CHECK NO ANTI-LIFT DEVICE

L2 *To check for an anti-lift switch or lever, slide a string or stiff card, (such as the emergency information card) under the bomb, without disturbing the bomb.*
If the string or card cannot be slipped under the bomb, it may indicate that an anti-lift switch or lever is present and that the bomb cannot be moved.
If a card is used and can be slid under the bomb, leave it under the bomb and move together with the bomb.
If it is not possible to move the bomb, then it should be surrounded with a single thin sheet of plastic (e. g. trash bag), then with wetted materials, and other blast attenuation materials such as seat cushions and soft carry-on baggage. Move personnel as far away from the bomb location as possible.

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

L1 EMERGENCY EQUIPMENT.......................................REMOVE AND STOW

L2 *Emergency equipment (PBE, fire extinguisher, etc.) located close to the LRBL must be removed and stowed in alternate location.*

L1 GALLEY/IFE POWER.......................................OFF

L2 *All galley and IFE equipment located close to the LRBL must be switched off.*

L1
- **If the bomb can be moved:**

  RH AFT CABIN DOOR SLIDE.......................................DISARM

  LEAST RISK BOMB LOCATION (LRBL).......................................PREPARE

L2 *Build up a platform of solid baggage against the door up to about 25 cm (10 in) below the middle of the door.*
On top of this, build up at least 25 cm (10 in) of wetted material such as blankets and pillows.
Place a single thin sheet of plastic (e.g. trash bag) on top of the wetted materials. This prevents any possible short circuit.

CAUTION	*DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.*

L1 BOMB INDICATION LINE.......................................POSITION

Note: *A bomb location indicator line is a 6 to 8 ft (1.8 to 2.4 m) (e.g. neckties, headset cord, or belts connected together) preferably of constrating color, that helps the responding bomb squad find the precise location of the suspect device within the LRBL stack once constructed.*

Position the bomb indication line from the location on the platform where you will place the suspect device, EXTENDING outward into the aisle.

BOMB.......................................MOVE TO LRBL

L2 *Carefully carry in the attitude found and place on top of the wetted materials in the same attitude and as close to the door structure as possible.*

CAUTION	*Ensure that the suspect device, when placed on the stack against the door, is above the slide pack but not against the door handle, and if possible, avoid placement in the view port.*

L1 LEAST RISK BOMB LOCATION (LRBL).......................................COMPLETE

L2 *Place an additional single thin sheet of plastic over the bomb.*

Continued on the following page

[QRH] BOMB ON BOARD (Cont'd)

CAUTION	*DO NOT OMIT THE PLASTIC SHEETS, AS THE SUSPECT DEVICE COULD GET WET AND POSSIBLY SHORT CIRCUIT ELECTRONIC COMPONENTS CAUSING INADVERTENT DEVICE ACTIVATION.*

L1

Build up at 25 cm (10 in) of wetted material around the sides and on top of the bomb.

DO NOT PLACE ANYTHING BETWEEN THE BOMB AND THE DOOR, AND MINIMIZE AIRSPACE AROUND THE BOMB.

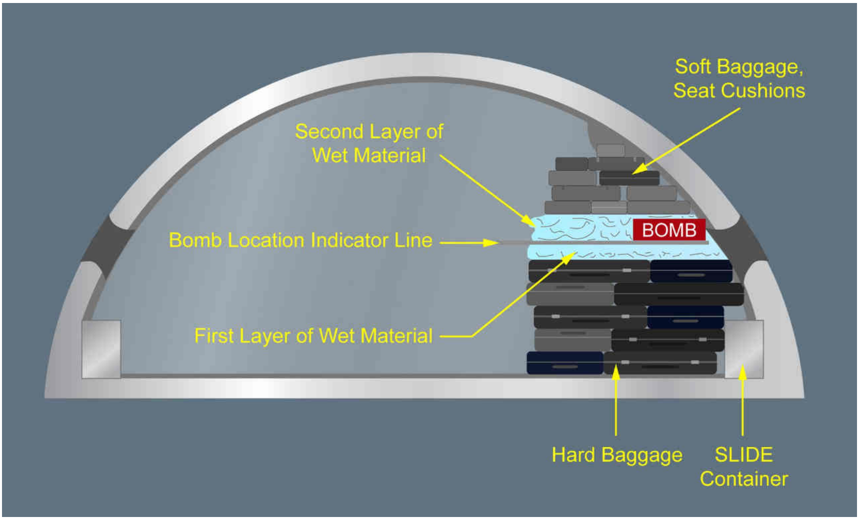
L2

The idea is to build up a protective surrounding of the bomb so that the explosive force is directed in the only unprotected area into the door structure.
Fill the area around the bomb with seat cushions and other soft materials such as hand luggage (saturated with water or any other nonflammable liquid) up to the cabin ceiling, compressing as much as possible. Secure the LRBL stack in place using belt, ties or other appropriate materials. The more material stacked around the bomb, the less the damage will be.

L1

USE ONLY SOFT MATERIAL. AVOID USING MATERIALS CONTAINING ANY INFLAMMABLE LIQUID AND ANY METAL OBJECTS WHICH COULD BECOME DANGEROUS PROJECTILES.

LRBL STACK



Soft Baggage,
Seat Cushions
Second Layer of
Wet Material
BOMB
Bomb Location Indicator Line
First Layer of Wet Material
Hard Baggage

[QRH] BOMB ON BOARD (Cont'd)

PASSENGERS.. MOVE/ADVISE

L2 *Move passengers at least 4 seat rows away from the least risk bomb location (RH aft cabin door). On full flights, it may be necessary to double up passengers to achieve standoff from the suspect device.*
Passengers near the bomb should protect their heads with pillows, blankets. All passengers must remain seated with seatbelts on and, if possible, head below the top of the head rest. Seat backs and tray tables must be in their full upright position.

L1 CABIN CREW.. NOTIFY COCKPIT CREW

L2 *Cabin crew notify the flight crew that the bomb is secured at the LRBL.*

L1 EVACUATION/DISEMBARKATION...EXECUTE

L2 *Evacuate through normal and emergency exits on the opposite side of the “bomb” location. Do not use the door just opposite the “bomb”.*
Use all available airport facilities to disembark without delay.

[QRH] COCKPIT WINDSHIELD / WINDOW ARCING

Ident.: PRO-ABN-MISC-00012099.0001001 / 17 MAR 17
Applicable to: ALL

Affected WINDOW / WINDSHIELD ANTI-ICE C/B... PULL

Pull the circuit breaker of the affected window/windshield heating system, in case of:
- *Electrical arcing of the cockpit windshield/window, or*
- *Burning smell or smoke identified as coming from the bottom right corner of CAPT windshield or bottom left corner of the F/O windshield.*

On the rear C/B panel:

- *ANTI-ICE L WSHLD AF10 C/B [123VU],*
- *ANTI-ICE R WSHLD AF03 C/B [123VU],*
- *ANTI-ICE/WINDOWS L X14 C/B [122VU],*
- *ANTI-ICE/WINDOWS R W14 C/B [122VU].*

[QRH] COCKPIT WINDSHIELD / WINDOW CRACKED

Ident.: PRO-ABN-MISC-00012097.0001001 / 04 DEC 18
Applicable to: ALL

SHOULDER HARNESS.. FASTEN
TOUCH THE CRACK WITH A PEN (OR CAREFULLY WITH FINGERNAIL)

- **If no crack on cockpit side:**

  NO LIMITATION

  The inner ply is not affected. Therefore, the window/windshield is still able to sustain the differential pressure up to the maximum flight level.

- **If cracks on cockpit side:**

  CREW OXY MASKS.. USE

  MAX FL: 230 / MEA-MORA

  The inner ply is affected. The flight crew is not able to easily determine if other plies are affected. Descend to FL 230/MEA and reduce differential pressure to 5 PSI .

  Note: The maximum flight level is restricted to FL 230/MEA to obtain ΔP 5 PSI , without resulting in an excessive cabin altitude and an EXCESS CAB ALT warning.

  The following procedure enables maintaining ΔP 5 PSI in manual cabin pressure mode.

  CAB PRESS MODE SEL.. MAN

  DISREGARD THE CAB ALT TARGET TABLE DISPLAYED ON THE ECAM
  MAN V/S CTL.. AS RQRD

  SET THE CABIN ALTITUDE ACCORDING TO THE TABLE BELOW TO MAINTAIN ΔP 5 PSI

FL	*100*	*150*	*200*	*230*
CABIN ALTITUDE	*0*	*3 000*	*6 000*	*8 000*

  - **When ΔP is 5 PSI:**

    CREW OXY MASKS.. REMOVE

  - **Below FL 100:**

    CAB PRESS MODE SEL.. AUTO

Note: Due to the increased noise level, pay particular attention to visual warnings.

- **If visibility not sufficient for approach due to damage:**

  CONSIDER AUTOLAND

  - **For approach, if AUTOLAND not available:**

    CAB PRESS MODE SEL.. MAN

DITCHING pb .... ON

L2 *The ditching direction mainly depends on the wind direction, and on the state of the sea. These factors may be considered as follows :*

1. Wind direction :
This may be determined by observing of the waves, which move and break downwind. Spray from the wave tops is also a reliable indicator.

2. Wind speed :

The following guidelines can be used to evaluate wind speed :

A few white crests	*8-17 kt*
Many white crests	*17-26 kt*
Streaks of foam along the water	*23-35 kt*
Spray from the waves	*35-43 kt*

3. Sea state :
This is best determined from a height of 500 to 1 000 ft.
At a lower altitude, the swell direction may be less obvious than the wave direction, even though the waves are much smaller.

4. When there is no swell, align into the wind. In the presence of swell, and provided that drift does not exceed 10 °, ditch parallel to the swell and as nearly into wind as possible. If drift exceeds 10 °, ditch into the wind. The presence of drift on touchdown is not dangerous, but every effort should be made to minimize roll.

[QRH] OVERWEIGHT LANDING

Ident.: PRO-ABN-MISC-00023093.0001001 / 17 NOV 20
Applicable to: ALL

USE CONF FULL FOR LANDING UNLESS SPECIFIED BY ABN PROC OR LIMITED BY LANDING PERF

LDG DIST PROC....................APPLY

- **For approach:**

  PACK 1....................OFF OR SUPPLIED BY APU
  PACK 2....................OFF OR SUPPLIED BY APU

L2 *The selection of the PACKS to OFF (or to APU BLEED) increases the maximum thrust available from the engines, in the case of a go-around.*

L1
  - **If landing CONF other than FULL:** USE CONF 1+F FOR GO AROUND

  SPEED AT RUNWAY THRESHOLD : VLS

L2 *This speed target is applicable to manual landing and autoland. Reduce the speed to reach VLS at the runway threshold.*

L1 MINIMIZE V/S AT TOUCHDOWN

L2 *Touch down as smoothly as possible to reduce the V/S. The maximum touchdown V/S should not exceed 360 ft/min. The main landing gears must touch down as symmetrically as possible.*

L1
- **For landing:**

  INCREASE FLARE HEIGHT

  USE MAX REVERSE ASAP

L2 *It is recommended to use the reverse as soon as possible, in order to limit the braking action.*

L1
  - **After nosewheel touchdown:** APPLY BRAKES AS NECESSARY

L2 *It is recommended that the flight crew uses the maximum available runway length to limit the braking energy.*

L1
- **When landing completed:**

  BRAKE FANS ◁✳ ....ON

L2 *Be prepared for tire deflation, if temperature exceed 800 °C.*

[QRH] SEVERE TURBULENCE

Ident.: PRO-ABN-MISC-10-00002202.0001001 / 17 MAR 17
Applicable to: ALL

Whenever possible, avoid areas with known or forecasted severe turbulence. If turbulence is unavoidable, aim to keep the speed in the region of the target speed given in this section, so as to provide the best protection against the effect of gust on the structural limits, whilst maintaining an adequate margin above VLS.
Sufficient buffet margin exists at optimum altitude. In order to further increase the margin to buffet onset, consider descending to a lower altitude.
Severe turbulence is defined as turbulence that causes large, abrupt changes in altitude and/or attitude. It usually causes large variations in airspeed. Occupants are forced violently against their seat belts and loose objects will move around the aircraft.
If severe turbulence occurs during a flight, the flight crew must make a logbook entry in order to initiate maintenance action.

Note: *Recommendations for severe turbulence are also applicable to extreme turbulence.*

Ident.: PRO-ABN-MISC-10-00002203.0001001 / 22 FEB 17
Applicable to: ALL

Before the aircraft enters an area where turbulence is expected:

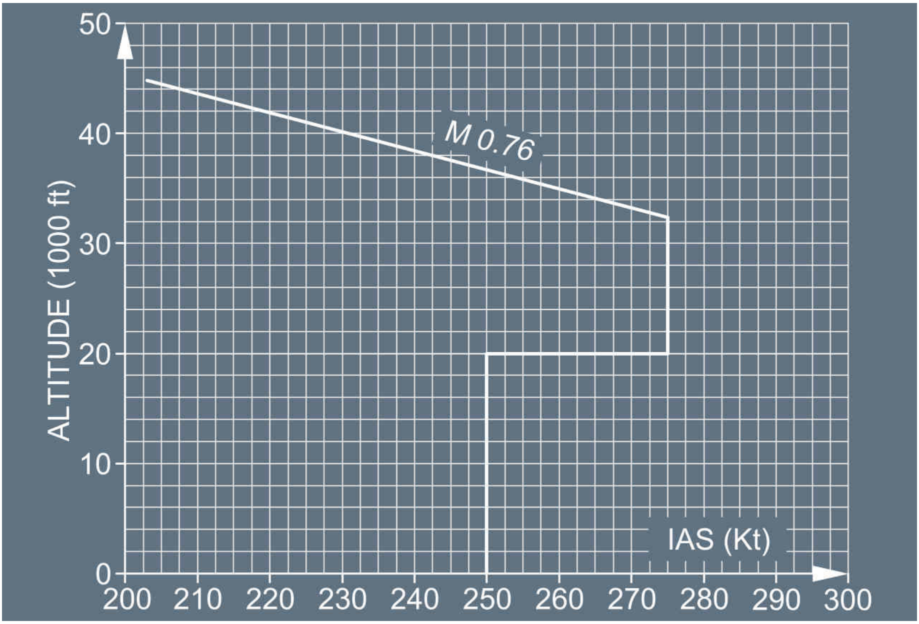
- All loose equipment must be secured in the cockpit and in the cabin
- The flight crew must set the SEAT BELTS sw to ON.

Ident.: PRO-ABN-MISC-10-00002301.0001001 / 09 DEC 09
Applicable to: ALL

Keep the autopilot ON.
When thrust changes become excessive : Disconnect Autothrust.
For approach : Use A/THR for managed speed.

Ident.: PRO-ABN-MISC-10-00002208.0004001 / 22 MAY 12
Applicable to: MSN 02321, 02887

Set the thrust to give the recommended speed (*Refer to PRO-ABN-MISC [QRH] Thrust Setting (N1) for Recommended Speed*). This thrust setting attempts to obtain, in stabilized conditions, the speed for turbulence penetration given in the graph below.
Only change thrust in case of an extreme variation in airspeed, and do not chase your Mach or airspeed.
A transient increase is preferable to a loss of speed, that decreases buffet margins and is difficult to recover.



Ident.: PRO-ABN-MISC-10-00002208.0008001 / 22 MAY 12

Applicable to: ALL

If the flight crew flies the aircraft manually:
- The flight crew may expect large variations in altitude, but should not chase altitude.
- The flight crew should consider descending to or below OPT FL, in order to increase the margin to buffet.

Ident.: PRO-ABN-MISC-10-00007388.0002001 / 29 SEP 15
Applicable to: ALL

Configuration FULL, or 3, can be used.
CONF FULL provides better handling capability in turbulent conditions, however, CONF 3 provides more energy and less drag.

[QRH] TAILSTRIKE

Ident.: PRO-ABN-MISC-00012273.0001001 / 04 JUN 19
Applicable to: ALL

LAND ASAP

MAX FL: 100 / MEA-MORA

500 ft/min should be targeted for the climb, to minimize pressure changes, and for passenger and crew comfort. Similarly, the rate of descent must be limited to about 1 000 ft/min, except for the final approach that must be performed normally.
Notify the ATC of the aircraft's rate of climb.

RAM AIR.......... ON
PACK 1.......... OFF
PACK 2.......... OFF

[QRH] VOLCANIC ASH ENCOUNTER

Ident.: PRO-ABN-MISC-00012176.0005001 / 17 MAR 17
Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

180° TURN..........INITIATE

The performance of a 180 ° turn will usually enable the aircraft to exit the volcanic ash clouds as quickly as possible, because volcanic ash clouds can extend for hundreds of nautical miles.

ATC..........NOTIFY

Note: *Electrostatic conditions may cause communication problems.*

A/THR..........OFF

This prevents the autothrust from generating thrust variations.

THRUST (IF CONDS PERMIT)..........REDUCE

Reduced thrust minimizes ash ingestion.
If altitude permits, reduce thrust to idle. This maximizes engine surge margin and lowers engine turbine temperature.

CREW OXY MASKS..........USE / 100 % / EMER
CABIN CREW..........NOTIFY
OXYGEN PASSENGER MASK MAN ON..........AS RQRD

Depending on contamination.

ENG ANTI ICE..........ON
WING ANTI ICE..........ON
ECON FLOW..........OFF

Maximum air bleed gives the engines additional stall margin.

CARGO ISOL VALVES ◁* ....OFF

Note: *To prevent a cargo smoke warning being triggered*

ENGINE PARAMETERS..........MONITOR

Monitor particularly EGT. If EGT exceeds limits, it may become necessary to consider a precautionary engine shutdown and engine restart in flight.

Note: *In the case of precautionary shutdown:*
- *restart when clear of the volcanic ash cloud*
- *Upon restart, the engine may accelerate very slowly. Do not misinterpret this as a failure to start*
- *Consider that the compressor and turbine blades have been eroded and avoid sudden changes in thrust. Fuel flow and EGT may increase.*

Continued on the following page

[QRH] VOLCANIC ASH ENCOUNTER (Cont'd)

AIRSPEED INDICATIONS....................MONITOR

If airspeed is unreliable or lost, Refer to PRO-ABN-NAV UNRELIABLE SPEED INDICATION - Memory Items.

Note: If both engines flame out and speed indications are lost, Refer to ALL ENGINES FAILURE procedure to get the required pitch attitude for the optimum relight speed. In case of engine failure, switch off the wing anti ice before engine restart.

- **If visibility not sufficient for approach due to windshield damage:**

  CONSIDER AUTOLAND

  - **For approach, if AUTOLAND is not available:**

    CAB PRESS MODE SEL....................MAN
    MAN V/S CTL....................FULL UP

    Due to the increased noise level, pay particular attention to visual warnings.

    MAX SPEED: 200 kt
    PF SLIDING WINDOW....................OPEN

180° TURN.......................INITIATE

The performance of a 180 ° turn will usually enable the aircraft to exit the volcanic ash clouds as quickly as possible, because volcanic ash clouds can extend for hundreds of nautical miles.

ATC.......................NOTIFY

Note: Electrostatic conditions may cause communication problems.

A/THR.......................OFF

This prevents the autothrust from generating thrust variations.

THRUST (IF CONDS PERMIT).......................REDUCE

Reduced thrust minimizes ash ingestion.
If altitude permits, reduce thrust to idle. This maximizes engine surge margin and lowers engine turbine temperature.

CREW OXY MASKS.......................USE / 100 % / EMER
CABIN CREW.......................NOTIFY
OXYGEN PASSENGER MASK MAN ON.......................AS RQRD

Depending on contamination.

ENG ANTI ICE.......................ON
WING ANTI ICE.......................ON
PACK FLOW.......................HI

Maximum air bleed gives the engines additional stall margin.

CARGO ISOL VALVES ◁ ....OFF

Note: To prevent a cargo smoke warning being triggered

ENGINE PARAMETERS.......................MONITOR

Monitor particularly EGT. If EGT exceeds limits, it may become necessary to consider a precautionary engine shutdown and engine restart in flight.

Note: In the case of precautionary shutdown:
- *restart when clear of the volcanic ash cloud*
- *Upon restart, the engine may accelerate very slowly. Do not misinterpret this as a failure to start*

Continued on the following page

[QRH] VOLCANIC ASH ENCOUNTER (Cont'd)

- *Consider that the compressor and turbine blades have been eroded and avoid sudden changes in thrust. Fuel flow and EGT may increase.*

AIRSPEED INDICATIONS....................MONITOR

If airspeed is unreliable or lost, Refer to PRO-ABN-NAV UNRELIABLE SPEED INDICATION - Memory Items.

Note: If both engines flame out and speed indications are lost, Refer to ALL ENGINES FAILURE procedure to get the required pitch attitude for the optimum relight speed. In case of engine failure, switch off the wing anti ice before engine restart.

- **If visibility not sufficient for approach due to windshield damage:**

  CONSIDER AUTOLAND

  - **For approach, if AUTOLAND is not available:**

    CAB PRESS MODE SEL....................MAN
    MAN V/S CTL....................FULL UP

    Due to the increased noise level, pay particular attention to visual warnings.

    MAX SPEED: 200 kt
    PF SLIDING WINDOW.................... OPEN

FLYING TECHNIQUE TO STABILIZE SPEED

Stabilize the altitude. When altitude is stabilized:

- If the pitch is above the target pitch, increase the thrust and maintain the altitude
- If the pitch is below the target pitch, decrease the thrust and maintain the altitude.

When the pitch reaches the target pitch, adjust the thrust to keep this target pitch.

Stabilize the altitude. When altitude is stabilized:

- If the pitch is above the target pitch, increase the thrust and maintain the altitude
- If the pitch is below the target pitch, decrease the thrust and maintain the altitude.

When the pitch reaches the target pitch, adjust the thrust to keep this target pitch.

LEVEL FLIGHT IN CLEAN CONFIGURATION						
		97 t **215 000 lb**	**90 t** **200 000 lb**	**80 t** **175 000 lb**	**70 t** **155 000 lb**	**60 t** **130 000 lb**

33

ANNUNCIATIONS

Triggering Conditions:

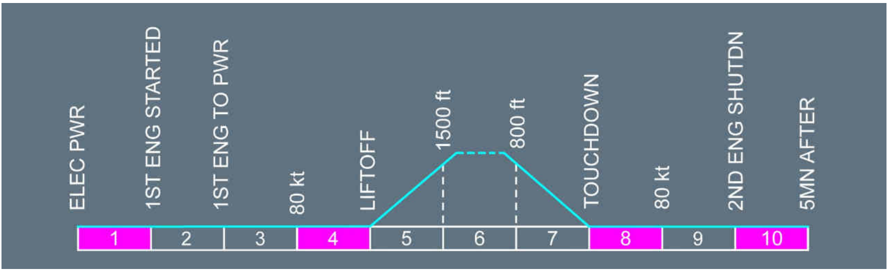
L2 This alert triggers when all speeds (ADRs and backup) are FAULT or UNCERTAIN.
This alert is associated with the display of the speeds status on ECAM status display.

Flight Phase Inhibition:



Ident.: PRO-ABN-NAV-BE-00023399.0001001 / 21 JAN 21

34

L2 Flight control normal laws are lost. Pitch alternate law preserves the neutral static stability. All protections, except maneuver protections are lost. This procedure requires to apply the Unreliable Speed Procedure for pitch/thrust table and troubleshooting.

The following messages are displayed:
ALL ADR SPD UNCERTAIN, and
BKUP SPD FAULT or BKUP SPD UNCERTAIN.

For the condition of each message, *Refer to DSC-34-NAV-10-30-20 Speed Monitoring Status*.

L1 UNREL SPD PROC....................APPLY
MAX SPEED....................280/.78

L2 *Speed is limited to ensure DBUS speed accuracy (Refer to DSC-34-NAV-10-30-20 Speed Monitoring Function).*

A/C POS..CHECK

The following procedure is not displayed on the ECAM:

■ **During climb, cruise, or descent:**

  Check accuracy on the MCDU PROG page:

  ■ **If ESTIMATED ACCUR below REQUIRED ACCUR:**

    CONSIDER NAV MODE AND ND ARC/ROSE NAV

  ■ **If ESTIMATED ACCUR above REQUIRED ACCUR:**

    HDG/TRK MODE...SELECT

    USE RAW DATA

    ● **For aircraft equipped with EGPWS ◁ or T2CAS ◁ :**

      CONSIDER SWITCHING OFF GPWS TERRAIN FUNCTIONS

  When possible, compare the positions of both FMs with the GPIRS position, on the MCDU POSITION MONITOR page:

  ■ **If one FM position agrees with onside GPIRS position:**

    USE ASSOCIATED AP/FD

  ■ **If both FM positions DO NOT agree with onside GPIRS position:**

    GPS..DESELECT

    USE RAW DATA

■ **During ILS/MLS ◁ /LOC/GLS ◁ approach:**

  NAV MODE: DO NOT USE

  CONTINUE APPROACH

■ **During LOC only approach with FLS ◁ :**

  NAV MODE: DO NOT USE

  DISREGARD F-G/S DEVIATION

  REVERT TO VERTICAL SELECTED MODE

■ **During RNAV GNSS, or RNAV RNP approach:**

  ● **If visual references not sufficient:** GO AROUND

Continued on the following page

NAV FM/GPS POS DISAGREE ◁ (Cont'd)

■ **During VOR, VOR-DME, NDB, or NDB-DME approach:**

HDG/TRK MODE.. SELECT

USE RAW DATA

- **If FLS ◁ used:**

  LS pb.. PRESS

  FLS deviations are removed from PFD.

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 01143-01246, 01376, 01518, 01593-01628

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 15 NOV 21

1

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE/FUMES APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke/fumes are confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required)....................USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION BLOWER....................OVRD
VENTILATION EXTRACT....................OVRD

Avionics ventilation air is extracted overboard.

CAB FANS....................OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALY & CAB....................OFF
SIGNS....................ON
CKPT / CABIN COM....................ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

- **If smoke/fumes source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT....................ISOLATE
- **If smoke/fumes source not immediately isolated:**
  DIVERSION....................INITIATE
  DESCENT TO FL 100 / MEA-MORA ....INITIATE

- **At ANY TIME of the procedure, if smoke/fumes become the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
  ELEC EMER CONFIG....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - ELEC EMER CONFIG

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING....................CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE alert is triggered, the crew may suspect avionics smoke.
- If smoke/fumes are detected while an equipment is declared faulty, the crew may suspect that smoke/fumes are coming from this equipment.
- Avionics or forward galley smoke/fumes may be smelt, or may enter in the cockpit before ECAM alert activation.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012214.0001001 / 15 NOV 21

- **If AIR COND smoke/fumes suspected:**
  APU BLEED....OFF
  VENTILATION BLOWER and EXTRACT....AUTO

  Note: *When both VENTILATION BLOWER and VENTILATION EXTRACT are in the OVRD position, a single pack may not be able to maintain the cabin pressure.*

  PACK 1....OFF
  - **If smoke/fumes continue:**
    PACK 1....ON
    PACK 2....OFF
    - **If smoke/fumes persist:**
      PACK 2....ON

      Restore normal configuration if PACK 2 is not suspected to cause smoke/fumes.

      VENTILATION BLOWER....OVRD
      VENTILATION EXTRACT....OVRD

  REMOVAL OF SMOKE / FUMES....CONSIDER

  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
- **If CABIN EQPT smoke/fumes suspected:**
  - **If smoke/fumes continue:**
    EMER EXIT LIGHT....ON
    BUS TIE....OFF
    GEN 2....OFF

    AC BUS 2 shedding can be considered in order to isolate most of the cabin equipments. The ECAM lower display, and the F/O's PFD and ND will be lost.

    SMOKE / FUMES DISSIPATION....CHECK
    FAULTY EQPT....SEARCH / ISOLATE

    Once the cabin has been secured, try to find the smoke/fumes source and isolate it. Cabin lights, reading lights, passenger systems, galleys have dedicated control C/B in the cabin or cockpit.
    - **If smoke/fumes persist or if faulty equipment confirmed isolated:**
      GEN 2....ON

      All busbars recovered when GEN 2 restored. But, TR 2 remains INOP.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

BUS TIE...AUTO

- **If faulty equipment not confirmed isolated:**
  - **Before L/G extension:**

    GEN 2...ON

    BUS TIE..AUTO

REMOVAL OF SMOKE / FUMES...CONSIDER

Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES

Ident.: PRO-ABN-SMOKE-D-00012215.0001001 / 15 NOV 21

- **If smoke/fumes source cannot be determined and persist or AVNCS / ELECTRICAL smoke/fumes suspected:**

  ELEC EMER CONFIG...CONSIDER

  Refer to the end of the procedure to set ELEC EMER CONFIG.

- **If smoke/fumes disappear within 5 min:**

  NORMAL VENTILATION...RESTORE

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012565.0017001 / 06 JUL 17

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE.......................................OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR.......................................MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN.......................................OFF
  GEN 2.......................................OFF

  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2.......................................ON
      EMER ELEC GEN 1 LINE.......................................ON

    - **When aircraft stopped:**

      ALL GENs.......................................OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED.......................................140 KT

    Note: *The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1 .... USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1 .... OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

- **At 3 min or 2 000 ft AAL before landing:**

  Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

  GEN 2 .... ON
  EMER ELEC GEN 1 LINE .... ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED .... 320 KT

Note: *Depending on the value of the engine total air temperature, the “EPR FAULT MODE" may be triggered, resulting in the degraded N1 MODE for both engines.*

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 01251

Ident.: PRO-ABN-SMOKE-D-00012212.0002001 / 15 NOV 21

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered or, at the latest, after completing the immediate actions of the AVIONICS SMOKE procedure (before reaching the 5 min countdown procedure line)
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

2

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

- **If smoke/fumes source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT....................ISOLATE
- **If smoke/fumes source not immediately isolated:**
  DIVERSION....................INITIATE
  DESCENT TO FL 100 / MEA-MORA ....INITIATE

- **At ANY TIME of the procedure, if smoke/fumes become the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
  ELEC EMER CONFIG....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - ELEC EMER CONFIG

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING....................CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke/fumes source:
- If smoke/fumes initially come out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE alert is triggered, the crew may suspect avionics smoke.
- If smoke/fumes are detected while an equipment is declared faulty, the crew may suspect that smoke/fumes are coming from this equipment.
- Avionics or forward galley smoke/fumes may be smelt, or may enter in the cockpit before ECAM alert activation.

Ident.: PRO-ABN-SMOKE-D-00024296.0002001 / 15 NOV 21

In case of perceptible smoke/fumes, remember that the smoke/fumes may come from the Cockpit Door Surveillance System (CDSS) LCD monitor:

- **If smoke/fumes from LCD monitor suspected :**
  CKPT DOOR VIDEO pb..OFF

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012214.0001001 / 15 NOV 21

- **If AIR COND smoke/fumes suspected:**

  APU BLEED.....OFF
  VENTILATION BLOWER and EXTRACT.....AUTO

  Note: *When both VENTILATION BLOWER and VENTILATION EXTRACT are in the OVRD position, a single pack may not be able to maintain the cabin pressure.*

  PACK 1.....OFF

  - **If smoke/fumes continue:**

    PACK 1.....ON
    PACK 2.....OFF

    - **If smoke/fumes persist:**

      PACK 2.....ON

      Restore normal configuration if PACK 2 is not suspected to cause smoke/fumes.

      VENTILATION BLOWER.....OVRD
      VENTILATION EXTRACT.....OVRD

  REMOVAL OF SMOKE / FUMES.....CONSIDER

  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES

- **If CABIN EQPT smoke/fumes suspected:**

  - **If smoke/fumes continue:**

    EMER EXIT LIGHT.....ON
    BUS TIE.....OFF
    GEN 2.....OFF

    AC BUS 2 shedding can be considered in order to isolate most of the cabin equipments. The ECAM lower display, and the F/O's PFD and ND will be lost.

    SMOKE / FUMES DISSIPATION.....CHECK
    FAULTY EQPT.....SEARCH / ISOLATE

    Once the cabin has been secured, try to find the smoke/fumes source and isolate it. Cabin lights, reading lights, passenger systems, galleys have dedicated control C/B in the cabin or cockpit.

    - **If smoke/fumes persist or if faulty equipment confirmed isolated:**

      GEN 2.....ON

      All busbars recovered when GEN 2 restored. But, TR 2 remains INOP.

Continued on the following page

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE....................OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR....................MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN....................OFF
  GEN 2....................OFF

  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2....................ON
      EMER ELEC GEN 1 LINE....................ON

    - **When aircraft stopped:**

      ALL GENs....................OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED....................140 KT

    Note: *The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1 .... USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1 .... OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

- **At 3 min or 2 000 ft AAL before landing:**

  Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

  GEN 2 .... ON
  EMER ELEC GEN 1 LINE .... ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED .... 320 KT

Note: *Depending on the value of the engine total air temperature, the “EPR FAULT MODE" may be triggered, resulting in the degraded N1 MODE for both engines.*

3

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012215.0001001 / 15 NOV 21

- **If smoke/fumes source cannot be determined and persist or AVNCS / ELECTRICAL smoke/fumes suspected:**

  ELEC EMER CONFIG...CONSIDER

  Refer to the end of the procedure to set ELEC EMER CONFIG.

- **If smoke/fumes disappear within 5 min:**

  NORMAL VENTILATION...RESTORE

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012565.0017001 / 06 JUL 17

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE..OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR..MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN..OFF
  GEN 2..OFF

  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2..ON
      EMER ELEC GEN 1 LINE..ON

    - **When aircraft stopped:**

      ALL GENs..OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED..140 KT

    Note: *The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1..USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1..OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

● **At 3 min or 2 000 ft AAL before landing:**

Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

GEN 2..ON
EMER ELEC GEN 1 LINE..ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED..320 KT

Note: *Depending on the value of the engine total air temperature, the “EPR FAULT MODE" may be triggered, resulting in the degraded N1 MODE for both engines.*

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 02321

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 15 NOV 21

6

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE/FUMES APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke/fumes are confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required)....................USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION BLOWER....................OVRD
VENTILATION EXTRACT....................OVRD

Avionics ventilation air is extracted overboard.

CAB FANS....................OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALY & CAB....................OFF
SIGNS....................ON
CKPT / CABIN COM....................ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

- **If smoke/fumes source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT....................ISOLATE
- **If smoke/fumes source not immediately isolated:**
  DIVERSION....................INITIATE
  DESCENT TO FL 100 / MEA-MORA....................INITIATE

- **At ANY TIME of the procedure, if smoke/fumes become the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
  ELEC EMER CONFIG....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - ELEC EMER CONFIG

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING....................CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE alert is triggered, the crew may suspect avionics smoke.
- If smoke/fumes are detected while an equipment is declared faulty, the crew may suspect that smoke/fumes are coming from this equipment.
- Avionics or forward galley smoke/fumes may be smelt, or may enter in the cockpit before ECAM alert activation.

Ident.: PRO-ABN-SMOKE-D-00024296.0002001 / 15 NOV 21

In case of perceptible smoke/fumes, remember that the smoke/fumes may come from the Cockpit Door Surveillance System (CDSS) LCD monitor:

● **If smoke/fumes from LCD monitor suspected :**
CKPT DOOR VIDEO pb....................................OFF

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 15 NOV 21

10

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE/FUMES APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke/fumes are confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required)....................USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION BLOWER....................OVRD
VENTILATION EXTRACT....................OVRD

Avionics ventilation air is extracted overboard.

CAB FANS....................OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALY & CAB....................OFF
SIGNS....................ON
CKPT / CABIN COM....................ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

- **If smoke/fumes source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT....................ISOLATE
- **If smoke/fumes source not immediately isolated:**
  DIVERSION....................INITIATE
  DESCENT TO FL 100 / MEA-MORA ....INITIATE

- **At ANY TIME of the procedure, if smoke/fumes become the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES....................CONSIDER

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING....................CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE alert is triggered, the crew may suspect avionics smoke.
- If smoke/fumes are detected while an equipment is declared faulty, the crew may suspect that smoke/fumes are coming from this equipment.
- Avionics or forward galley smoke/fumes may be smelt, or may enter in the cockpit before ECAM alert activation.

TO SET ELEC EMER CONFIG

EMER ELEC GEN 1 LINE...OFF

GEN 1 LINE contactor opens. GEN 1 remains running and supplies one fuel pump in each wing tank. AC BUS 1 is supplied by GEN 2 through the bus tie contactor.

EMER ELEC PWR...MAN ON

RAT is extended and the EMER GEN is connected to the aircraft network. Check emergency generator parameters on the ELEC SD page (displayed automatically).

- **When EMER GEN AVAIL:**

  APU GEN...OFF
  GEN 2...OFF

  ELEC EMER CONFIG

  Two different procedures can be displayed on the ECAM, depending on whether the AVIONICS SMOKE ECAM caution is triggered or not before the flight crew sets the electrical emergency configuration.

  - **If AVIONICS SMOKE not triggered:**

    APPLY ELEC EMER CONFIG PROCEDURE, BUT DO NOT RESET GEN, EVEN IF REQUESTED BY ECAM

    - **At 3 min or 2 000 ft AAL before landing:**

      Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

      GEN 2...ON
      EMER ELEC GEN 1 LINE...ON

    - **When aircraft stopped:**

      ALL GENs...OFF

  - **If AVIONICS SMOKE triggered:**

    The ECAM displays a specific ELEC EMER CONFIG procedure. The flight crew must apply the following ECAM procedure.

    MIN RAT SPEED...140 KT

    Note: *The electrical configuration is the same as for loss of both generators (except that one fuel pump in each wing tank remains supplied).*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

VHF 1 / HF 1 / ATC 1 .... USE

Only VHF 1, HF 1 and ATC 1 are supplied in this configuration. Notify the ATC of the nature of the emergency, and state intentions. If there is no contact with the ATC, switch to code A7700, or transmit a distress message on one of the emergency frequencies.

FAC 1 .... OFF THEN ON

Rudder trim is recovered, despite the fact that no indication is available.

- **At 3 min or 2 000 ft AAL before landing:**

  Restore all generators only 3 min before landing or at 2 000 ft AAL to recover normal braking, while minimizing possible reactivation of a smoke source.

  GEN 2 .... ON
  EMER ELEC GEN 1 LINE .... ON

F/CTL ALTN LAW (PROT LOST)

Flight control normal laws and associated protections are lost. Only the load factor limitation, and the high and low speed stability remain (ALTN law with reduced protection).

MAX SPEED .... 320 KT

[QRH] SMOKE / FUMES / AVNCS SMOKE

Applicable to: MSN 06139, 06173

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 15 NOV 21

17

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE/FUMES APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke/fumes are confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required)....................USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION BLOWER....................OVRD
VENTILATION EXTRACT....................OVRD

Avionics ventilation air is extracted overboard.

CAB FANS....................OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALY & CAB....................OFF
SIGNS....................ON
CKPT / CABIN COM....................ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

- **If smoke/fumes source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT....................ISOLATE
- **If smoke/fumes source not immediately isolated:**
  DIVERSION....................INITIATE
  DESCENT TO FL 100 / MEA-MORA ....INITIATE

  IMMEDIATE LANDING....................CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE alert is triggered, the crew may suspect avionics smoke.
- If smoke/fumes are detected while an equipment is declared faulty, the crew may suspect that smoke/fumes are coming from this equipment.
- Avionics or forward galley smoke/fumes may be smelt, or may enter in the cockpit before ECAM alert activation.

Continued on the following page

Ident.: PRO-ABN-SMOKE-D-00012212.0004001 / 15 NOV 21

21

This procedure includes all the steps of the AVIONICS SMOKE procedure.

Apply this procedure when:
- The flight (cabin) crew suspect that smoke/fumes are coming from any of the following:
  - The avionics
  - The air conditioning
  - The cabin equipment
- The AVIONICS SMOKE alert is triggered.
- There is a smell of smoke/fumes in the cockpit:
  - If the smell is similar to that of orange peels, suspect a toxic leak of rain repellent fluid.
  - If the smell is similar to that of pine needles, suspect a non-toxic leak.

If any other ECAM SMOKE alert triggers (CARGO, ...), the crew must first apply the ECAM procedure, then consider applying this procedure.
Note that these ECAM alerts may be caused by another source, that should usually first be detected by the flight crew/cabin crew/avionics smoke detectors.

The following explains the layout of this procedure:
- The procedure lines above the boxed items indicate the actions that the flight crew must immediately perform, if smoke/fumes are detected (with or without ECAM activation and regardless of the smoke/fumes source). These immediate actions correspond to the most common steps to be taken in smoke/fumes cases. In all cases, the flight crew must also be prepared to immediately perform a diversion. However, this diversion may be avoided if the smoke/fumes source is obvious, accessible and extinguishable or confirmed isolated (after completion of the immediate actions).
- The boxed items indicate the actions that the flight crew must consider, if at any time during the remainder of the procedure but always after the initial steps:
  - Smoke/fumes become the greatest threat and removal of smoke/fumes is required, and/or
  - The situation becomes critical and can no longer be controlled.
- The procedure lines below the boxed items indicate the actions that the flight crew must perform, as soon as they suspect a source of smoke/fumes. The actions will depend on whether the smoke/fumes are coming from the avionics, and/or air conditioning, and/or cabin equipment.

LAND ASAP

IF PERCEPTIBLE SMOKE/FUMES APPLY IMMEDIATELY:

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

If smoke/fumes are confirmed, the following procedure must be applied.

OXY MASK / GOGGLE (if required)....................USE/100%/EMERG

Ensure crew communication is established. Avoid continuous use of the interphone to minimize interference from the oxygen mask breathing noise.
Turn the emergency knob to remove condensation or smoke/fumes from the mask.

VENTILATION BLOWER....................OVRD
VENTILATION EXTRACT....................OVRD

Avionics ventilation air is extracted overboard.

CAB FANS....................OFF

To prevent smoke/fumes from entering the cockpit and cabin.

GALY & CAB....................OFF
SIGNS....................ON
CKPT / CABIN COM....................ESTABLISH

Communication must be established with the cabin crew in order to follow up on the smoke/fumes origin and dissipation.

- **If smoke/fumes source immediately obvious, accessible, and extinguishable:**
  FAULTY EQPT....................ISOLATE
- **If smoke/fumes source not immediately isolated:**
  DIVERSION....................INITIATE
  DESCENT TO FL 100 / MEA-MORA ....INITIATE

- **At ANY TIME of the procedure, if smoke/fumes become the GREATEST THREAT:**
  REMOVAL OF SMOKE / FUMES....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] REMOVAL OF SMOKE / FUMES
  ELEC EMER CONFIG....................CONSIDER
  Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - ELEC EMER CONFIG

- **At ANY TIME of the procedure, if situation becomes UNMANAGEABLE:**
  IMMEDIATE LANDING....................CONSIDER
  L2 *Depending on the situation, the Captain can consider an overweight landing, a tailwind landing, a ditching, a forced landing, etc.*

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

L1 Guidelines to determine smoke/fumes source:

- If smoke/fumes initially come out of the ventilation outlets, the crew may suspect AIR COND SMOKE. In addition, very shortly thereafter, several SMOKE alerts (cargo, lavatory, avionics) will be triggered. The displayed ECAM procedures must be applied.
- After an ENG or APU failure, smoke/fumes may come from the faulty item via the bleed system and be perceived in the cockpit and/or cabin. In such a case, it will be recirculated throughout the aircraft, until it completely disappears from the air conditioning system.
- If only the AVIONICS SMOKE alert is triggered, the crew may suspect avionics smoke.
- If smoke/fumes are detected while an equipment is declared faulty, the crew may suspect that smoke/fumes are coming from this equipment.
- Avionics or forward galley smoke/fumes may be smelt, or may enter in the cockpit before ECAM alert activation.

Continued on the following page

[QRH] SMOKE / FUMES / AVNCS SMOKE (Cont'd)

Ident.: PRO-ABN-SMOKE-D-00012214.0005001 / 15 NOV 21

- **If AIR COND smoke/fumes suspected:**

  APU BLEED....................OFF
  VENTILATION BLOWER and EXTRACT....................AUTO

  Note: When both VENTILATION BLOWER and VENTILATION EXTRACT are in the OVRD position, a single pack may not be able to maintain the cabin pressure.

  CARGO FWD ISOL VALVE....................OFF

  To prevent a cargo smoke/fumes warning from being triggered due to cabin smoke/fumes.

  PACK 1....................OFF

  - **If smoke/fumes continue:**

    PACK 1....................ON
    PACK 2....................OFF

    - **If smoke/fumes persist:**

      PACK 2....................ON

      Restore normal configuration if PACK 2 is not suspected to cause smoke/fumes.

      VENTILATION BLOWER....................OVRD
      VENTILATION EXTRACT....................OVRD

  REMOVAL OF SMOKE / FUMES....................CONSIDER

[QRH] REMOVAL OF SMOKE / FUMES

Ident.: PRO-ABN-SMOKE-00012218.0001001 / 05 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

Apply this [QRH] REMOVAL OF SMOKE / FUMES procedure, if smoke/fumes become the greatest threat when applying the [QRH] SMOKE / FUMES / AVNCS SMOKE procedure.

EMER EXIT LIGHT..ON

- **If fuel vapors:**

  CAB FANS..ON

  The recirculating air ventilates the air mixer bay and other fuselage area. This prevents fuel vapors from accumulating and the risk of explosion. Passenger health is not affected.

  PACK 1..OFF
  PACK 2..OFF

- **If no fuel vapors:**

  CAB FANS..OFF

  To prevent smoke/fumes from entering the cockpit and cabin.

  PACK FLOW..HI

  To provide maximum airflow from the packs.
  Do not shut down the air conditioning packs, and do not reduce ventilation in an attempt to smother the fire.
  Do not deploy oxygen masks, if fire is suspected in the cabin.

LDG ELEV.. 10 000 ft / MEA-MORA
DESCENT TO FL 100 / MEA-MORA..INITIATE

The most effective means of smoke/fumes removal is use of ram air. Therefore, descent is initiated to FL 100 or the MEA-MORA, while the cabin altitude is increased to 10 000 ft or the MEA-MORA. The increase in cabin altitude also reduces, at least temporarily, the smoke/fumes concentration. Cabin depressurization starts, when descent is initiated.

ATC..NOTIFY
SMOKE / FUMES / AVNCS SMOKE PROC..CONTINUE

Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

- ● **At FL 100 or MEA-MORA:**
  - ● **If in ELEC EMER CONFIG:**

    APU MASTER sw ....ON

Continued on the following page

[QRH] REMOVAL OF SMOKE / FUMES (Cont'd)

In electrical emergency configuration, when the APU MASTER sw is ON, the battery contactors will automatically close for a maximum of 3 min. This will enable the flight crew to manually control the outflow valve that is powered by the DC BAT BUS.

PACK 1 .... OFF
PACK 2 .... OFF

In electrical emergency configuration, the PACK 2 flow control valve cannot close because it is not electrically supplied. Therefore PACK 2 remains operative even when PACK 2 pb is set to OFF.

CABIN PRESS MODE SEL .... MAN
MAN V/S CTL .... FULL UP
RAM AIR .... ON

At FL 100, or MEA-MORA, it is possible to open the RAM AIR valve when ΔP is 1 PSI or below. Opening the RAM AIR enables flying with both packs OFF.

APU MASTER sw .... OFF

- **If smoke/fumes persist:**

  If there is smoke/fumes in the cockpit, open the cockpit window to evacuate the smoke/fumes.

  MAX SPEED: 200 kt
  COCKPIT DOOR .... OPEN
  HEADSETS .... ON
  PM SLIDING WINDOW .... OPEN

  - **When window open:**

    NON-AFFECTED PACK(s) .... ON
    VISUAL WARNINGS (noisy cockpit) .... MONITOR

    Due to the increased noise level, pay particular attention to visual warnings.

    SMOKE / FUMES / AVNCS SMOKE PROC .... CONTINUE

    Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

[QRH] REMOVAL OF SMOKE / FUMES

Ident.: PRO-ABN-SMOKE-00012218.0003001 / 05 MAY 22

27 **Applicable to: MSN 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11597**

Apply this [QRH] REMOVAL OF SMOKE / FUMES procedure, if smoke/fumes become the greatest threat when applying the [QRH] SMOKE / FUMES / AVNCS SMOKE procedure.

EMER EXIT LIGHT......ON

- **If fuel vapors:**
  CAB FANS......ON
  The recirculating air ventilates the air mixer bay and other fuselage area. This prevents fuel vapors from accumulating and the risk of explosion. Passenger health is not affected.
  PACK 1......OFF
  PACK 2......OFF

- **If no fuel vapors:**
  CAB FANS......OFF
  To prevent smoke/fumes from entering the cockpit and cabin.
  PACK FLOW......HI
  To provide maximum airflow from the packs.
  Do not shut down the air conditioning packs, and do not reduce ventilation in an attempt to smother the fire.
  Do not deploy oxygen masks, if fire is suspected in the cabin.

LDG ELEV...... 10 000 ft / MEA-MORA
DESCENT TO FL 100 / MEA-MORA ......INITIATE

The most effective means of smoke/fumes removal is use of ram air. Therefore, descent is initiated to FL 100 or the MEA-MORA, while the cabin altitude is increased to 10 000 ft or the MEA-MORA. The increase in cabin altitude also reduces, at least temporarily, the smoke/fumes concentration. Cabin depressurization starts, when descent is initiated.

ATC......NOTIFY
SMOKE / FUMES / AVNCS SMOKE PROC......CONTINUE

Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

- **At FL 100 or MEA-MORA:**
  - **If in ELEC EMER CONFIG:**
    APU MASTER sw ......ON

Continued on the following page

[QRH] REMOVAL OF SMOKE / FUMES (Cont'd)

In electrical emergency configuration, when the APU MASTER sw is ON, the battery contactors will automatically close for a maximum of 3 min. This will enable the flight crew to manually control the outflow valve that is powered by the DC BAT BUS.

PACK 1..OFF
PACK 2..OFF
CABIN PRESS MODE SEL..........................MAN
MAN V/S CTL...................................FULL UP
RAM AIR.......................................ON

At FL 100, or MEA-MORA, it is possible to open the RAM AIR valve when ΔP is 1 PSI or below. Opening the RAM AIR enables flying with both packs OFF.

APU MASTER sw ....OFF

- **If smoke/fumes persist:**

  If there is smoke/fumes in the cockpit, open the cockpit window to evacuate the smoke/fumes.

  MAX SPEED: 200 kt
  COCKPIT DOOR..................................OPEN
  HEADSETS......................................ON
  PM SLIDING WINDOW.............................OPEN

  - **When window open:**
    NON-AFFECTED PACK(s)........................ON
    VISUAL WARNINGS (noisy cockpit).............MONITOR

    Due to the increased noise level, pay particular attention to visual warnings.

    SMOKE / FUMES / AVNCS SMOKE PROC............CONTINUE

    Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

[QRH] REMOVAL OF SMOKE / FUMES

Ident.: PRO-ABN-SMOKE-00012218.0004001 / 05 MAY 22
Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662, 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

Apply this [QRH] REMOVAL OF SMOKE / FUMES procedure, if smoke/fumes become the greatest threat when applying the [QRH] SMOKE / FUMES / AVNCS SMOKE procedure.

EMER EXIT LIGHT.......................................ON

■ **If fuel vapors:**

CAB FANS.......................................ON

The recirculating air ventilates the air mixer bay and other fuselage area. This prevents fuel vapors from accumulating and the risk of explosion. Passenger health is not affected.

PACK 1.......................................OFF
PACK 2.......................................OFF

■ **If no fuel vapors:**

CAB FANS.......................................OFF

To prevent smoke/fumes from entering the cockpit and cabin.

ECON FLOW.......................................OFF

To provide maximum airflow from the packs.
Do not shut down the air conditioning packs, and do not reduce ventilation in an attempt to smother the fire.
Do not deploy oxygen masks, if fire is suspected in the cabin.

LDG ELEV.......................................10 000 ft / MEA-MORA
DESCENT TO FL 100 / MEA-MORA.......................................INITIATE

The most effective means of smoke/fumes removal is use of ram air. Therefore, descent is initiated to FL 100 or the MEA-MORA, while the cabin altitude is increased to 10 000 ft or the MEA-MORA. The increase in cabin altitude also reduces, at least temporarily, the smoke/fumes concentration. Cabin depressurization starts, when descent is initiated.

ATC.......................................NOTIFY
SMOKE / FUMES / AVNCS SMOKE PROC.......................................CONTINUE

Refer to PRO-ABN-SMOKE [QRH] SMOKE / FUMES / AVNCS SMOKE - GENERAL

● **At FL 100 or MEA-MORA:**

  ● **If in ELEC EMER CONFIG:**

  APU MASTER sw.......................................ON

Continued on the following page

[QRH] REMOVAL OF SMOKE / FUMES (Cont'd)

In electrical emergency configuration, when the APU MASTER sw is ON, the battery contactors will automatically close for a maximum of 3 min. This will enable the flight crew to manually control the outflow valve that is powered by the DC BAT BUS.

PACK 1..OFF

LAND ASAP

FWD ISOL VALVE ◁ .... OFF

L2 *If FWD ISOL VALVE ◁ is not automatically closed.*

L1 ● **On ground:**

● **IF FWD CRG CLOSED:**

L2 Order the ground crew not to open the door of the affected cargo compartment, unless the passengers have disembarked and fire services are present. Also ensure that the FWD cargo door is closed before discharging the extinguishing agent.

L1 AGENT.. DISCH

Note: Expect the SMOKE warning to remain after agent discharge, even if the smoke source is extinguished. Gases from the smoke source are not evacuated, and smoke detectors are also sensitive to the extinguishing agent.

Note:

1. *For aircraft equipped with FWD Cargo Ventilation ◁ , if the warning has been displayed temporarily, and agent has not been discharged, normal cargo ventilation may be recovered when ventilation is required for livestock transportation:*
   C/B of CARGO VENT controller (T20 on 122VU, or C8 on 49VU, as installed for FWD CARGO) ...... PULL then PUSH
2. *On ground, the warning may be triggered due to a high level of humidity or insecticide spraying. Provided that the smoke is not visually confirmed and the warning is no more displayed:*
   - *Deactivate the smoke detection system, by pulling the SDCU 1 and 2 reset pb-sw*
   - *Reset the cargo ventilation system, by pulling and pushing the AIR COND/FWD CARGO/VENT/CTL & MONG circuit breaker (C8 on 49VU)*
   - *At cargo doors closure, reactivate SDCU 1 and 2.*

[MEM] TCAS CAUTION - TRAFFIC ADVISORY

Ident.: PRO-ABN-SURV-00025023.0002001 / 16 MAY 22
3 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

L2 If the AP/FD TCAS mode is available, the TCAS mode arms on FMA.

L1 TCAS mode....................CHECK ARMED

L2 If the AP/FD TCAS mode does not arm, the flight crew must be prepared to disconnect the AP in the case of a RA, and manually follow the TCAS guidances.

L1
- **If the A/THR is off:**

AUTOTHRUST....................ON

L2 It is recommended to set the A/THR to ON in order to avoid the AUTO FLT A/THR LIMITED alert at the automatic A/THR activation that occurs in the case of a RA.

L1 Do not perform a maneuver based on a TA alone.

[MEM] TCAS CAUTION - TRAFFIC ADVISORY

Ident.: PRO-ABN-SURV-00025023.0001001 / 16 MAY 22

Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

Do not perform a maneuver based on a TA alone.

[MEM] TCAS WARNING - RESOLUTION ADVISORY

Ident.: PRO-ABN-SURV-00012455.0031001 / 16 MAY 22
4 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

Always follow RA orders, even if this results in crossing the intruder altitude, because these orders ensure the best altitude separation.

CAUTION	Be aware that the intruder may have a TCAS, and may maneuver in response to a coordinated RA order. Therefore, not following an RA order could compromise safe separation.

■ **If the AP/FD TCAS mode is available:**

L2 The flight crew applies this procedure, when a RA is triggered, and the AP/FD TCAS mode engages. The AP/FD TCAS mode follows the RA orders.

L1 ● **All RA, except any CLIMB RA during approach in CONF 3 or FULL:**

● **If the AP is OFF:**

FD ORDERS.. FOLLOW
The AP can be engaged.

VERTICAL SPEED..MONITOR

L2 If a preventive RA was triggered: check that the vertical speed remains out of the red area of the vertical speed scale.

If a corrective RA was triggered: check that the vertical speed gets out of the red area, and remains in the green area of the vertical speed scale.

L1

CAUTION	If for any reason during a RA, the aircraft vertical speed does not reach the green area of the vertical speed scale, the PF should disconnect the AP, and override the FD orders, in order to lead the aircraft vertical speed out of the red area of the vertical speed scale. If necessary, the PF must use the full speed range between Vαmax and VMAX.

● **Any CLIMB RA during approach in CONF 3 or FULL:**

GO-AROUND.. PERFORM

L2 The AP/FD TCAS mode disengages (the AP/FD does no longer follows the RA orders).

L1 Follow the SRS GA mode.

VERTICAL SPEED..MONITOR

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L2 Check that the vertical speed remains out of the red area of the vertical speed scale and take over if necessary.

L1 Respect stall, GPWS or windshear warnings.

ATC...NOTIFY

- **When the "CLEAR OF CONFLICT" aural alert sounds:**

L2 The AP/FD TCAS mode, if engaged, disengages.

L1
AP/FD...MONITOR/FOLLOW
ATC...NOTIFY
LATERAL AND VERTICAL GUIDANCE...ADJUST

L2 The flight crew should engage an appropriate vertical mode, or adjust the vertical speed target, in accordance with the latest ATC clearance.

L1 SPEED...ADJUST

L2 The flight crew should adjust the speed target, and revert to managed speed, as appropriate.

L1 ■ **If the AP/FD TCAS mode is not available:**

L2 The flight crew applies this procedure, when a RA is triggered, and the AP/FD TCAS mode does not engage.

L1
- **All RA, except CLIMB RA during approach in CONF 3 or FULL:**

AP (if engaged)...OFF
BOTH FDs...OFF

Respond promptly and smoothly.

VERTICAL SPEED...ADJUST or MAINTAIN

L2 Adjust or maintain the vertical speed as required, to reach the green area and/or avoid the red area of the vertical speed scale.

L1 _Note:_ *Avoid excessive maneuvers while attempting to maintain the vertical speed just outside the red area of the vertical speed scale, and within the green area. If necessary, use the full speed range between Vαmax and VMAX.*

- **Any CLIMB RA during approach in CONF 3 or FULL:**

GO-AROUND...PERFORM

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

Follow the SRS GA mode.

VERTICAL SPEED	MONITOR

L2

Check that the vertical speed remains out of the red area of the vertical speed scale and take over if necessary.

L1

Respect stall, GPWS or windshear warnings.

ATC	NOTIFY

L2 Adjust the lateral and vertical guidance to resume normal navigation, in accordance with ATC clearance.

Continued on the following page

[MEM] TCAS WARNING - RESOLUTION ADVISORY (Cont'd)

L1 AP/FD..AS RQRD

L2 If necessary, reengage the AP/FD.

[MEM] WINDSHEAR WARNING - REACTIVE WINDSHEAR

Ident.: PRO-ABN-SURV-00012271.0002001 / 04 NOV 20
Applicable to: ALL

If Windshear is detected, both PFDs display a WINDSHEAR message. An associated aural WINDSHEAR alert sounds three times.
If the flight crew detects WINDSHEAR, apply the following recovery technique:

- **At Takeoff:**
  - **If before V1:**

    If there are significant variations in airspeed, and in airspeed trend below the indicated V1, reject the takeoff.

    L2 *If windshear occurs during the takeoff roll, the aircraft may reach V1 later (or sooner) than expected. The flight crew should ensure that there is sufficient runway remaining to stop the aircraft, if necessary.*

  - L1 **If after V1:**

    THR LEVERS.....TOGA
    REACHING VR.....ROTATE
    SRS ORDERS.....FOLLOW

    If necessary the flight crew may pull the sidestick fully back.

    Note: If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary, to prevent a loss in altitude, increase the pitch attitude.

- **Airborne, initial climb or landing:**

  THR LEVERS AT TOGA.....SET OR CONFIRM
  AP (if engaged).....KEEP ON
  SRS ORDERS.....FOLLOW

  If necessary the flight crew may pull the sidestick fully back.

  Note: 1. Autopilot disengages if the angle of attack value goes above α prot.
  2. If the FD bars are not displayed, move toward an initial pitch attitude of 17.5 °. Then, if necessary, to prevent a loss in altitude, increase the pitch attitude.

  DO NOT CHANGE CONFIGURATION (SLATS/FLAPS, GEAR) UNTIL OUT OF WINDSHEAR.
  CLOSELY MONITOR FLIGHT PATH AND SPEED.
  RECOVER SMOOTHLY TO NORMAL CLIMB OUT OF WINDSHEAR.

GENERAL

Ident.: PRO-ABN-90-00010415.0001001 / 15 OCT 12
Applicable to: ALL

A successful outcome for an emergency situation depends, first of all, upon each crew member's perfect knowledge and execution of the duties assigned to him.
The captain should check frequently that all crew members know exactly their assigned positions and their specific duties, as well as the duties of the other crew members, in case of an abnormal or an emergency condition.
Since it is not possible to cover all the situations that may occur, the captain will be responsible for adapting the following instructions to obtain the best coordination of the emergency operation.
Should it be physically impossible for the captain to carry out his duties, another crew member will substitute for him according to the chain of command. The procedures in this manual are AIRBUS procedures and should be considered to be a reference.

COCKPIT-ASSIGNED DUTIES FOR EVACUATION

Ident.: PRO-ABN-90-00010416.0001001 / 03 NOV 21
Applicable to: ALL

■ **If it is NOT POSSIBLE to reach the passenger cabin:**

The flight crew member should evacuate the aircraft via the cockpit clearview windows, by using the escape ropes.

On ground, each flight crew member must help passengers, and direct them away from the aircraft.

■ **If it is POSSIBLE to reach the passenger cabin:**

CAPT	- Is the last person to leave the cockpit: Proceeds to the cabin, and helps with passenger evacuation, as necessary - Is the last person to leave the aircraft: Checks that all persons have evacuated the aircraft - Evacuates the aircraft, via the rear door, or any other available exit, if the flight crew cannot reach the rear door. - On ground, the flight crew takes command of operations until rescue units arrive.
F/O	- Proceeds to the cabin, and takes the emergency equipment. - Evacuates the aircraft, using any available exit. - Helps passengers on ground, and directs them away from the aircraft.

Note: *The procedures are established for the minimum required number of 5 cabin crew.*
For customized seating configurations of 200 passengers seats or less, the minimum required cabin crew can be reduced to 4 (JAR-OPS 1.990).
When the minimum required cabin crew is reduced to 4, occupancy of AFT RH seat is not required.
However, one cabin crew must be seated on the center swivel cabin attendant seat (if installed).

COMMUNICATIONS

Ident.: PRO-ABN-90-00010418.0001001 / 27 FEB 18
Applicable to: ALL

1. EMERGENCY CALL

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- Press EMER pb-sw on the CALLS panel, or - Passenger Address (PA) System: "PURSER TO COCKPIT PLEASE!"	Purser must immediately go to the cockpit.
CABIN	COCKPIT	- Interphone: "PRIO CAPT"	Any cabin crewmember can make such a call. The cockpit crew must reply.

2. EMERGENCY ALERT

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "ATTENTION CREW! AT STATIONS!"	The cockpit crew makes a short and precise announcement to warn that an emergency evacuation may soon be required. Cabin crews must proceed to their emergency stations.

3. NOTIFICATION TO PASSENGERS

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- SIGNS ON - PA System	For psychological reasons, the cockpit crew should be the first to inform of an intended emergency landing.
PURSER	CABIN	- CABIN LIGHTS 100 % - PA System	Purser informs passengers that they have to pay special attention to these warnings: - “FINISH PREPARATION” - “BRACE FOR IMPACT” - “EVACUATE, EVACUATE”

4. FINISH PREPARATION

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- Passenger Address (PA) System: "FINISH PREPARATION"	The cockpit crew gives this order a short time before an emergency landing.

5. BRACE FOR IMPACT

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "BRACE FOR IMPACT!"	The cockpit crew announces to brace for impact approximately 1 min before landing.

6. INITIATE EVACUATION (RESTRICTED EXITS)

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "EVACUATE, EVACUATE" - Activate EVAC signals ◁✳	The cockpit crew orders an immediate evacuation, and the cabin crew directs passengers to all available exists.
CABIN	COCKPIT AND CABIN	- EVAC SIGNAL SYSTEM ◁✳ on FWD ATTND panel (FAP) - PA System or megaphone	Used by the cabin crew, if there is no signal or order from the cockpit, and if it is unmistakably clear that the aircraft must be evacuated.
CABIN	CABIN	- Verbal	The cabin crew stands up and shouts: - "SEATBELTS OFF!" - "LEAVE EVERYTHING!" - "GET OUT!" - "COME THIS WAY!"

7. EVACUATION NOT REQUIRED

FROM	TO	COMMUNICATION METHOD(S)	REMARKS
COCKPIT	CABIN	- PA System: "CABIN CREW and PASSENGERS REMAIN SEATED!"	When the Captain decides that an evacuation is not required, the cockpit crew makes an immediate announcement to this effect.

ON GROUND EVACUATION

Applicable to: ALL

Ident.: PRO-ABN-90-A-00010419.0001001 / 16 JAN 18

COCKPIT CREW PROCEDURES

The cockpit crew notifies the cabin crew of the nature of the emergency, and states intentions. The cockpit crew uses the Passenger Address system to make an appropriate announcement, such as: “EVACUATE, EVACUATE”, and presses the EVAC COMMAND pb.

Ident.: PRO-ABN-90-A-00010420.0001001 / 26 JAN 18

CABIN CREW PROCEDURES

When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:

STAND UP AND SHOUT..“UNFASTEN SEATBELTS”
OUTSIDE CONDITIONS...CHECK

■ **If outside conditions are safe:**

DOOR IN ARMED POSITION...OPEN FIRMLY
SHOUT..“COME THIS WAY”

● **If the door does not open automatically:**

DOOR..PUSH AND OPEN MANUALLY

SLIDE (or SLIDERAFT) DEPLOYMENT.....................................CHECK FULL DEPLOYMENT

It takes approximately 4 s for the slide (or slideraft) to deploy.

● **If the slide (or slideraft) does not automatically inflate:**

RED, MANUAL INFLATION HANDLE...PULL

The red, manual inflation handle is located on the right-hand side of the slide (or slideraft) girt extension.

ORDER...“EVACUATE, EVACUATE”
PASSENGER EVACUATION ....EXPEDITE

● **If the slide (or slideraft) becomes unserviceable:**

PASSENGER EVACUATION..STOP
PASSENGERS TO ANOTHER USABLE EXIT...REDIRECT

TOTAL ZONE EVACUATION..CHECK
CABIN CREW... EVACUATE
PASSENGERS AWAY FROM THE AIRCRAFT...DIRECT

■ **If outside conditions are unsafe:**

EXIT DOOR...BLOCK
PASSENGERS TO NEAREST USABLE EXIT...REDIRECT

COCKPIT EVACUATION THROUGH WINDOW

Applicable to: ALL

Ident.: PRO-ABN-90-B-00010421.0001001 / 05 AUG 10

OPENING THE SLIDING WINDOW

HANDLE.......................................PUSH DOWN AND PULL BACK

Pulling the handle backwards, opens the sliding window.

Ident.: PRO-ABN-90-B-00010422.0001001 / 24 NOV 15

COCKPIT EVACUATION WITH ESCAPE ROPE

ESCAPE ROPE STOWAGE.......................................OPEN

The escape rope stowage is located above the sliding window, on either side of the overhead panel.

ESCAPE ROPE.......................................UNROLL

Unroll the escape rope, and throw it through the window.

SEAT.......................................STEP ON
ESCAPE ROPE.......................................GRASP

Grasp the escape rope firmly with both hands, and slide down along the rope.

EVACUATION ON WATER

Ident.: PRO-ABN-90-C-00010423.0001001 / 05 AUG 10

3 **Applicable to: MSN 01143-01158, 01459, 02321, 02734-02924, 03032-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04544, 04734-04773, 04953-05345, 05591-05883, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**

CABIN CREW RESPONSIBLE FOR TYPE "I" DOORS

When the cabin receives the order to evacuate, each cabin crewmember must proceed as follows:

CHILDREN LIFEVESTS.......................................DISTRIBUTE
STAND UP AND SHOUT..........“UNFASTEN SEATBELTS – PUT ON YOUR LIFEVEST”

Inflate the lifevest, only once outside the aircraft.

ORDER.......................................“REMOVE SHOES”

- **If the Type I door is usable:**
  DOOR IN ARMED POSITION.......................................OPEN
  SLIDE.......................................DEPLOY
  RED, MANUAL INFLATION HANDLE.......................................PULL

  Do not wait for automatic inflation of the slide.

■ **If the water level is close to the door sill:**

The slide inflates on the water.

SLIDE....................LEAVE ATTACHED TO CABIN FLOOR
PASSENGER LIFEVESTS....................INFLATE WHEN EVACUATING AIRCRAFT
PASSENGERS....................EVACUATE

Evacuate passengers into the water. The slide is used as a flotation device.

TOTAL ZONE EVACUATION....................CHECK
LAST CREWMEMBER....................EVACUATE
SLIDE....................SEPARATE FROM DOOR SILL

The last crewmember must separate the slide from the door sill.

MOORING LINE....................CUT

■ **If the water level is too far away from the door sill:**
SLIDE....................DISCONNECT FROM DOOR SILL

The slide remains tied to the aircraft by a 6 m (20 ft) mooring line.

MOORING LINE....................HOLD

To keep the slide close to the exit, hold the mooring line.

PASSENGER LIFEVESTS....................INFLATE WHEN EVACUATING AIRCRAFT
PASSENGERS....................EVACUATE

Evacuate passengers into the water. The slide is used as a flotation device.

TOTAL ZONE EVACUATION....................CHECK
LAST CREWMEMBER....................EVACUATE
MOORING LINE....................CUT

PASSENGERS.......... BOARD SLIDERAFT
TOTAL ZONE EVACUATION.......... CHECK
LAST CREWMEMBER.......... BOARD SLIDERAFT

The last crewmember must board with all the necessary safety equipment.

MOORING LINE.......... CUT
SURVIVAL KIT.......... RETRIEVE

The survival kit is attached to the slideraft via a lanyard.

Note: *Evacuation is usually done through the passenger doors. However, if one of the passenger doors is not usable, the overwing exit may be used for evacuation. The cabin crew should install the lifeline to help passenger to stay on the wing. These passengers will, however, be obliged to wait on the wing until the slideraft arrives, and until all other passengers have evacuated from the passenger door exits, and have finished boarding the sliderafts.*

FOREWORD

1 Ident.: PRO-NOR-SOP-01-20806557.9001001 / 02 MAY 23
Applicable to: ALL

The procedures contained in this Chapter are recommended by Airbus, and are consistent with the other Chapters of this manual.
The manufacturer presents them herein as the best way to proceed, from a technical and operational standpoint. Some of these procedures were modified in order to meet Airline's operational needs.
They are continually updated and the revisions take into account Operator input, as well as manufacturer experience.
The following sections contain expanded information on normal procedures.
Standard Operating Procedures consist of inspections, preparations, and normal procedures. All items of a given procedure are listed in a sequence that follows a standardized scan of the cockpit panels, unless that sequence goes against the action priority logic, to ensure that all actions are performed in the most efficient way.
These procedures assume that all systems are operating normally, and that all automatic functions are used normally.
Standard Operating Procedures consider that both pilots use Electronic Flight Bag (EFB). Airbus recommends operating with two EFBs in order to reduce the risk of erroneous inputs.
The FCOM also contains normal procedures that are non-routine procedures in the Supplementary Procedures chapter and in the Special Operations chapter.

GOLDEN RULES FOR PILOTS

2 Ident.: PRO-NOR-SOP-01-20806558.9001001 / 02 MAY 23
Applicable to: ALL

INTRODUCTION

The Airbus "Golden Rules for Pilots" are operational guidelines, based on all of the following:
- Basic flying principles
- The adaptation of these basic flying principles to modern-technology aircraft
- The provision of information about required crew coordination for the operation of Airbus aircraft.

The objective of these Golden Rules is to also take into account the principles of flight crew interaction with automated systems, and the principles of Crew Resource Management (CRM), in order to help prevent the causes of many accidents or incidents and to ensure flight efficiency.

GENERAL GOLDEN RULES

The following four Golden Rules for Pilots are applicable to all normal operations, and to all unexpected or abnormal/emergency situations:

1. ***Fly. Navigate. Communicate:*** *In this order and with appropriate tasksharing.*
   Fly! Navigate! Communicate! The flight crew must perform these three actions in sequence and must use appropriate tasksharing in normal and abnormal operations, in manual flight or in flight with the AP engaged.

The following explains each of the three actions, and the steps associated with the performance of these actions:

- ***Fly***

  "**Fly**" indicates that:
  - **The Pilot Flying (PF)** must concentrate on "**flying the aircraft**" to monitor and control the pitch attitude, bank angle, airspeed, thrust, sideslip, heading, etc., in order to achieve and maintain the desired targets, vertical flight path, and lateral flight path.
  - **The Pilot Monitoring (PM)** must assist the PF and must **actively monitor** flight parameters, and call out any excessive deviation. The PM's role of "actively monitoring" is very important.

  Therefore, both flight crewmembers must:
  - Focus and concentrate on their tasks to ensure appropriate tasksharing
  - Maintain situational awareness and immediately resolve any uncertainty as a crew.
- ***Navigate***

  "**Navigate**" refers to and includes the following four ***"Know where ..."*** statements, in order to ensure situational awareness:
  - Know **where you are…**
  - Know **where you should be…**
  - Know **where you should go…**
  - Know **where the weather, terrain, and obstacles are.**
- ***Communicate***

  "Communicate" involves effective and appropriate crew communication between the:
  - PF and the PM
  - Flight crew and Air Traffic Control (ATC)
  - Flight crew and the cabin crew
  - Flight crew and the ground crew.

  Communication enables the flight crew to safely and appropriately perform the flight, and enhance situational awareness. To ensure good communication, the flight crew should use **standard phraseology** and the **applicable callouts.**

  In abnormal and emergency situations, the PF must recover a steady flight path, and the flight crew must identify the flight situation. The PF must then inform ATC and the cabin crew of:
  - ■ The flight situation
  - ■ The flight crew's intentions.

  The flight crew must therefore always keep in mind the key message:

  Fly the Aircraft, Fly the Aircraft, Fly the Aircraft...

To safely and appropriately perform a flight, both flight crewmembers must have basic flying skills, and must be able to fly with appropriate tasksharing in all situations.

2. ***Use the appropriate level of automation at all times.***
   Aircraft are equipped with several levels of automation, used to perform specific tasks. The flight crew must determine the appropriate level of interaction with automated systems, based on the flight situation (e.g. Visibility, incapacitation, system malfunction, etc.), and the task to be performed.

   To use the appropriate level of automation at all times, the flight crew must:
   - **Determine and select** the appropriate level of automation that can include manual flight
   - **Understand** the operational effect of the selected level of automation
   - **Confirm that the aircraft reacts as expected.**
3. ***Understand the FMA at all times.***
   The flight crew must confirm the operational effect of all actions on the FCU, or on the MCDU, via a crosscheck of the corresponding annunciation or data on the PFD and on the ND.

   At all times, the flight crew should be aware of the following:
   - Guidance modes (armed or engaged)
   - Guidance targets
   - Aircraft response in terms of attitude, speed, and trajectory
   - Transition or reversion modes.

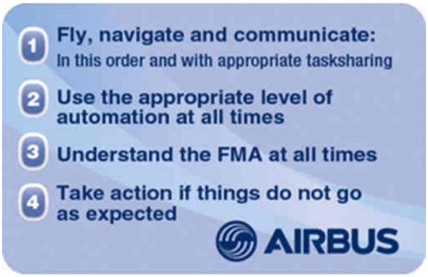
   Therefore, to ensure correct situational awareness, at all times, the flight crew must:
   - **Monitor the FMA**
   - **Announce the FMA**
   - **Confirm the FMA**
   - **Understand the FMA.**
4. ***Take action if things do not go as expected***

   If the aircraft does not follow the desired vertical or lateral flight path, or the selected targets, and if the flight crew does not have sufficient time to analyze and solve the situation, the flight **crew must immediately take appropriate or required actions**, as follows:

   The PF should change the level of automation:
   - From managed guidance to selected guidance, or
   - From selected guidance to manual flying.

   The PM should perform the following actions in sequence:
   - Communicate with the PF
   - Challenge the actions of the PF, when necessary
   - Take over, when necessary.

GOLDEN
RULES
FOR PILOTS
AIRBUS



1. **Fly, navigate and communicate:**
   In this order and with appropriate tasksharing
2. **Use the appropriate level of automation at all times**
3. **Understand the FMA at all times**
4. **Take action if things do not go as expected**

AIRBUS

AIRLINES POLICY

3 Ident.: PRO-NOR-SOP-01-20806559.9001001 / 02 MAY 23
Applicable to: ALL

The Airline Policy chapter contains a set of rules defined by the company. These rules were created and are always being updated according to its needs as well as local regulations. All rules may be found on the respective airline's Operations Manual, but the ones that directly affect procedures contained on the FCOM may be found in this manual.

GENERAL POLICIES

- The CM1 must be the left hand seat pilot
- The CM2 must be the right hand seat pilot

Both Pilots are allowed to taxi the aircraft.

If the CM2 is a F/O, the following restrictions apply:
- 180 ° turns on runways without runway turn pad marking
- Contaminated taxiways/runways

- Airports previously specified by Flight Operations
- Aircraft dispatched with any failure that may affect directional control and/or brake system.

When approaching to parking spots with self-docking system available only to the CM1, this one must park the aircraft.

NIGHT OPERATION

Visual APP Night operation is not recommended.
At night operations always select, when is possible, a runway equipped with visual approach slope indicator system such as PAPI or VASI for landing.

If not VASI/PAPI available, use the following priority approaches procedures for landing, bearing in mind, when is possible, to use the FD as an additional guidance from MAP to 50 ft HAT over the RWY Threshold (*):
1. ILS
2. RNAV (RNP)
3. RNAV (GNSS) LNAV/VNAV minimums
4. RNAV (GNSS) LNAV minimums only, VOR or LOC Approaches

(*) for NON ILS approaches, FD will be useful as an additional vertical guidance when a RWY Waypoint is included into the MCDU. For all other cases, FD must be switched off.

PF AND PM ASSIGNMENT

The PF and PM assignments start after the "PRELIMINARY PERFORMANCE DETERMINATION" is completed by both pilots.

SHOULDER HARNESS

The crewmembers must use the shoulder harness before pushback until FL 100/ 10.000 ft (10.000 ft AFE for airports with elevation at 4.000 ft or above) and from top of descent until engine shutdown.

ROLLER SUN-BLIND

The Roller Sun-Blind (sun-screen) must not be used under FL 100/ 10.000 ft (10.000 ft AFE for airports with elevation at 4.000 ft or above) or during TAXI, TAKEOFF, APPROACH and LANDING.

HEADSETS

The crewmembers must use the headsets from the engine start procedure until the end of the climb phase and from the beginning of descent phase until the end of the parking procedure.
The loudspeakers will be used as a communication backup and the volume may be adjusted as described on Cockpit Preparation (1 o’clock position). *Refer to 00011252 **Not found***

The crewmembers when using other frequencies (ATIS, Company, etc.), should set the loudspeaker knob to OFF and use the headsets in order to not interfere with the usual ACFT x ATC communication.

Note: *When using VHF 2 together with any other channel, pilots must use the headsets and silence the loudspeaker volume.*

Note: *Every time that the headsets have not been used, pilots will set the INT reception knob to neutral position and the loudspeaker shall be readjusted to a desired comfortable position.*

FMGS DATA

The following actions are assigned to the pilots as they are described (either being CM1 or CM2):
- The PF is responsible for the FMGS initialization and data insertion
- The PM must always perform the data confirmation.

Note: *The Pilot in Command can adjust the tasksharing due to safety reasons.*

Note: *All the messages displayed on MCDU must be crosschecked by both pilots before clearing them.*

CRUISE / ESCAPE ROUTE

In Order to improve situational awareness, crew members must consider the escape route when applicable. This may be accomplished using:
- FIX INFO page
- SEC F-PLN page
- The company's escape route contained in the EFB.

EMERGENCY DESCENT

In case of Emergency Descent the PF, after completing the memory items, will make the EMER DESCENT (PA) announcement.

REJECTED TAKEOFF

Please observe the following rules regarding Rejected Takeoffs (RTO):
- If the Co-Pilot is flying as PF, he may even callout a failure but only the Captain may call STOP and perform the RTO actions. As soon as the Captain calls STOP, the Co-Pilot becomes the PM.
- If the CM1 is a Captain under training and is flying as PF, he/she may make the decision and perform the RTO actions. In this case, the Instructor Captain (CM2) will continue as PM.
- If it happens that the CM1 is a Captain under training and is flying as PF but the Instructor Captain (CM2) thinks a stop is required, the Instructor will call STOP and the Captain under training will perform the RTO actions.

Both Emergency and Rejected Takeoff Briefings must be done by either the Instructor Captain or the Captain under training.

DUTIES TRANSFER

According to recommendations and industry best practicies, some actions require duties transfer:

- Expanded information for passengers in cruise
- FLB/MLB when performed by PF
- Any situation which requires PF not to control the flight in case necessary.

In order to perform the duties transfer follow the procedure: *Refer to 00011914 **Not found***

FLIGHT OPERATIONS PUBLICATIONS

The flight crew must be updated and aware of the Operations Manual content along with the current Flight Operations Bulletins.
It is important to remember that all documents published by the Flight Operations and Flight Safety Department might have valuable information for the flight as well.

GPS PRIMARY AVAILABILITY (IF INSTALLED)

Ident.: PRO-NOR-SOP-02-00014998.0001001 / 02 MAY 23
Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734

1
- **For RNP1/RNP2/RNP4 operations, RNAV(GNSS) approaches and RNAV(RNP) approaches:**

  If required by operational regulation, an appropriate Ground-Based Prediction Program should be used to check the RAIM/AIME for each intended procedure (arrival, departure, alternate if required).

GPS PRIMARY AVAILABILITY (IF INSTALLED)

Ident.: PRO-NOR-SOP-02-00014998.0002001 / 02 MAY 23
2 **Applicable to: MSN 01459, 02887-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

3
- **For RNP1/RNP2/RNP4 operations, RNAV(GNSS) approaches and RNAV(RNP) approaches:**

  RAIM/AIME has been demonstrated to be available 100% of the time with 24 healthy satellites.

  If required by operational regulation, for specific conditions (e.g RNAV(RNP), mountainous terrain or less than 24 satellites) an appropriate Ground-Based Prediction Program should be used to check the RAIM/AIME for each intended procedure (arrival, departure and alternate if required)

Intentionally left blank

SAFETY EXTERIOR INSPECTION

Applicable to: ALL

1 Ident.: PRO-NOR-SOP-03-A-20806561.9001001 / 02 MAY 23

GENERAL

Items marked by asterisks (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.

Safety exterior inspections ensure that the aircraft and the external environment of the aircraft are safe for operation. When the flight crew arrives at the aircraft, they must check for, or be informed of any obstructions near the aircraft, engineering activity, or refueling activity, etc.

2 Ident.: PRO-NOR-SOP-03-A-20806562.9001001 / 02 MAY 23

WHEEL CHOCKS

WHEEL CHOCKS... CHECK | CM2

L2 *If the wheel chocks are not in position, the flight crew must check that the parking brake is set with sufficient accumulator pressure.*

LANDING GEAR DOORS

LANDING GEAR DOORS...CHECK POSITION | CM2

WARNING	*If any landing gear door is open, do not pressurize the hydraulic systems until clearance is obtained from ground personnel.*

4 Ident.: PRO-NOR-SOP-03-A-20806564.9001001 / 02 MAY 23

APU AREA

APU AREA.. CHECK | CM2

L2 *Observe that the APU inlet and outlet are clear.*

Intentionally left blank

GENERAL

1 Ident.: PRO-NOR-SOP-04-20806565.9001001 / 02 MAY 23
Applicable to: ALL

Items marked by asterisks (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.
The flight crew performs the preliminary cockpit preparation to ensure that all required safety checks are completed.
The safety checks prevent the inadvertent operation of aircraft systems, danger to the aircraft, and danger to the personnel.

AIRCRAFT SETUP

Applicable to: ALL

2 Ident.: PRO-NOR-SOP-04-A-20806566.9001001 / 02 MAY 23

GENERAL

WARNING If the aircraft is not energized, first check MLB or consult maintenance staff to ensure that the aircraft can be energized.
Do not pressurize the hydraulic systems until clearance is obtained from ground personnel.

L2 *Use VHF 1 for ATC (only VHF 1 is available in emergency electrical configuration), VHF 2 for ATIS and company frequencies. VHF 3 is normally devoted to ACARS.*

9 Ident.: PRO-NOR-SOP-04-C-20806573.9001001 / 02 MAY 23

APU FIRE

WARNING	The automatic shutdown of the APU and the discharge of the APU fire extinguisher bottle may occur if the flight crew presses the APU FIRE test pb for more than 3 seconds.

APU FIRE pb-sw	CHECK IN and GUARDED	CM2
APU AGENT light	CHECK OFF	CM2
APU FIRE TEST pb	PRESS and MAINTAIN	CM2

TEST RESULT

Check that the APU fire detection and extinguishing system is operative:

- APU FIRE warning on (if AC power available):
  - ECAM
  - CRC
  - MASTER WARN light
- APU FIRE pb-sw lighted red (lighted partially if AC power not available)
- SQUIB light and DISCH light on

10 Ident.: PRO-NOR-SOP-04-C-20806574.9001001 / 02 MAY 23

APU START

The APU start should be delayed until 5 minutes prior to the estimated time of departure or when doors close, whichever occurs first. The APU may be started earlier in the following conditions:
- When no external power unit is available
- When there's no ACU available and the cockpit/cabin temperature is above 26 °C or at or below 17 °C.

Note: If it's not able to control the temperature in the parameters described above using the external power unit, the APU must be used.

■ **If the EXT PWR pb-sw ON light is on:**

APU MASTER SW pb-sw .... ON | CM2
APU START pb-sw .... ON | CM2

Note: Wait at least 3 s before selecting APU START pb-sw.

L2 *For more information on the APU start, Refer to 00017438 **Not found**.*

For more information on APU starter limitations and APU operations during refueling:
- *Refer to 00020088 **Not found***
- *Refer to 00020091 **Not found**.*

L1 * EXT PWR pb-sw .... AS RQRD | CM2

L2 *The flight crew should keep ON the external power units to reduce the APU load, particularly in hot weather conditions.*

L1 ■ **If the EXT PWR pb-sw ON light is off:**

APU MASTER SW pb-sw .... ON | CM2
APU START pb-sw .... ON | CM2

Note: Wait at least 3 s before selecting APU START pb-sw.

L2 *For more information on the APU start, Refer to 00017438 **Not found**.*

For more information on APU starter limitations and APU operations during refueling:
- *Refer to 00020088 **Not found***
- *Refer to 00020091 **Not found**.*

L1 AIR COND

● **When the APU is AVAIL:**

APU BLEED pb-sw .... ON | CM2

L2 *Do not use APU BLEED, if the ground personnel confirms that a LP or HP ground air unit is connected to the aircraft. To determine if an HP ground air unit is connected, the flight crew should also check on the BLEED SD page, if there is pressure in the bleed air system.*

L1	ALL WHITE LIGHTS	OFF	CM2

L2 *Full range temperature 24 ± 6 °C (75 ± 11 °F).*

ADIRS

Ident.: PRO-NOR-SOP-04-00011159.0038001 / 02 MAY 23
Applicable to: MSN 01459

11 **ADIRS**

* All IR MODE selectors........NAV | CM2

CAUTION	*To avoid damage of the RTLU (Ruder Travel Limit Unit) mechanical stop, the SLAT/FLAP should be retracted before ADIRS alignment procedure. After full alingment of ADIRS if OAT is above 30 °C the flaps lever should be selected to 1 position to extend the slats and flaps again to avoid the "AIR L (R) WING LEAK" warning.*

L2 *Align or realign IRS as appropriate. Refer to FCTM/PR-NP-SOP-60 ADIRS Operations.*

L1

Note: *In order to prevent an erroneous data initialization, wait at least 12 min after power-up and then select the ADIRS to NAV.*

L2 A complete IRS alignment must be performed in the following cases:
- Before the first flight of the day, or
- When there is a crew change, or
- When the departure airport is located between latitudes 2 ° north and 2 ° south, or
- When the GPS is not available and the NAVAID coverage is poor on the expected route, or
- When the GPS is not available and the expected flight time is more than 3 h.

A fast IRS alignment must be performed if a complete IRS alignment is not necessary and the difference between the IRS position and the FMGC position is at or above 5 NM (see MCDU POSITION MONITOR page).
To perform an alignment, the aircraft must be stopped on ground. Do not align IRS during engine start, or while the engines are running. In the case of aircraft movement during the IRS alignment, the flight crew must perform a new full alignment.

EFB STATUS PAGE

* EFB SYNCHRO AVIONICS .... CLICK | CM1-CM2
* EFB STATUS page.................................. INSERT/CHECK | CM1-CM2

L2 On the EFB STATUS page, each flight crewmember checks or, inserts and checks (if no EFB SYNCHRO AVIONICS):
- ACFT TYPE and ACFT REG
- FLT NBR and FROM/TO (in agreement with the FMS ACTIVE/INIT page).

AIRCRAFT ACCEPTANCE

22 Ident.: PRO-NOR-SOP-04-20806585.9001001 / 02 MAY 23
Applicable to: ALL

* RCL pb ....PRESS 3 s | CM1

L2 *This action recalls all the warnings that the flight crew cleared or cancelled during the last flight*

L1 * LOGBOOK AND MEL/CDL ITEMS..................................CHECK | BOTH

L2
- *Check the deferred items list.*
- *Crosscheck with ECAM recall.*

All flight crew members:
- *Check and discuss the technical condition of the aircraft (deferred items list)*
- *Check and discuss the MEL items (including the associated operational procedures, if any) and the CDL items. This includes the acceptability of the MEL and CDL items and the influence on the flight plan*
- *Activate the MEL and CDL items (the activated MEL and CDL items are sent to the performance applications.*

L1 * AIRCRAFT CONFIGURATION SUMMARY..................................CHECK | BOTH

L2 *For awareness of the current aircraft configuration, both flight crewmembers discuss together the optional installed aircraft systems and functions, and their influence on the ongoing flight.*

L1 * OEB..................................CHECK | BOTH

L2 *All flight crewmembers review and discuss together all OEBs and associated procedures applicable to the aircraft.*
Any flight crewmember who operates at the flight deck at any time during the on-going flight should be aware of the applicable OEB(s).

L1 * AIRCRAFT ACCEPTANCE..................................PERFORM | CM1

Note: *The aircraft acceptance can be performed later, but must be completed at the end of the Cockpit Preparation.*

PRELIMINARY PERFORMANCE DETERMINATION

23 Ident.: PRO-NOR-SOP-04-20806586.9001001 / 02 MAY 23
Applicable to: ALL

For more information, *Refer to FCTM/PR-NP-SOP-PRELIMINARY COCKPIT PREPARATION-Preliminary Takeoff Performance Computation*.

Note: *In the event of a short turn around time, the PRELIMINARY PERFORMANCE DETERMINATION may be done after returning from EXTERIOR WALKAROUND.*

Each flight crewmember independently computes the preliminary performance data in accordance with the technical condition of the aircraft and/or any other criteria that may affect the aircraft performance (e.g. NOTAM, runway condition, aircraft configuration).

* AIRFIELD DATA....................OBTAIN | CM1-CM2

L2 *Obtain data needed for initializing the system, preparing the cockpit and for preliminary takeoff performance computation. The airfield data should include: RUNWAY IN USE, ALTIMETER SETTING, and WEATHER DATA.*

L1
- **If the LOADSHEET application is used:**
  - * PRELIMINARY LOADING....................COMPUTE AND CROSSCHECK | CM1-CM2
- **If dispatch under MEL and in accordance with the logbook:**
  - * MEL/CDL ITEMS (as appropriate)....................CHECK ACTIVATED | CM1-CM2

L2 *As appropriate, check that the MEL and CDL items are activated in the applicable T.O PERF application.*

L1 * NAV CHARTS CLIPBOARD....................PREPARE | BOTH

L2 *Prepare the necessary charts and verify that both flight crewmembers refer to the same chart reference.*

L1 * PRELIMINARY TAKEOFF PERF DATA....................COMPUTE | CM1-CM2

L2 *Both flight crewmembers discuss together and decide all of the following:*
- *RWY to be used*
- *RWY intersection*
- *Optimum Flap*
- *Use of anti-ice*
- *Use of packs*
- *Takeoff thrust setting options (FLEX, TOGA, DERATE).*

The PF and the PM independently compute the preliminary takeoff performance data.

L1 * PRELIMINARY TAKEOFF PERF DATA.. CROSSCHECK | BOTH

L2 *The PF and the PM compare and ensure that the computations are the same.*

BEFORE WALKAROUND

Applicable to: ALL

EMERGENCY EQUIPMENT

EMER EQPT .... CHECK | PM

L2 *Check that:*

- *Life vests are stowed*
- *Crash axe is stowed*
- *Protective Breathing Equipment (PBE) is stowed and ready for use*
- *Portable fire extinguisher is lockwired and the pressure gauge indicator is in the green area*
- *Smoke goggles are stowed (smoke hoods ◁)*
- *Oxygen masks are stowed*

- *Flashlights are stowed*
- *Escape ropes are stowed.*

28 Ident.: PRO-NOR-SOP-04-E-20806592.9001001 / 02 MAY 23
Applicable to: ALL

RAIN REPELLENT

RAIN RPLNT indicators ....CHECK PRESSURE and QUANTITY | PM

CAUTION	*Never use rain repellent to wash the windshield and never use it on a dry windshield.*

29 Ident.: PRO-NOR-SOP-04-E-20806593.9001001 / 02 MAY 23
Applicable to: ALL

REAR AND OVERHEAD CIRCUIT BREAKERS PANELS

REAR and OVERHEAD CIRCUIT BREAKERS panels.................................. CHECK | PM

L2 *Check that all circuit breakers are set. Reset as necessary.*

30 Ident.: PRO-NOR-SOP-04-E-20806594.9001001 / 02 MAY 23
Applicable to: ALL

LANDING GEAR PINS

* GEAR PINS .... CHECK ONBOARD and STOWED | PM

L2 *Check that the three gear pins are on board and stowed.*

GENERAL

1 Ident.: PRO-NOR-SOP-05-20806595.9001001 / 02 MAY 23
Applicable to: ALL

The CM1 must perform the complete EXTERIOR WALKAROUND procedure when taking on the aircraft, however due to operational reasons this action may be delegated to CM2.
If there is no flight crew or aircraft change, the PM will be responsible for the subsequent exterior inspections.

Note: *Crewmembers must wear hearing protection devices, safety reflective vest and all other personal protective equipment, when appropriate, during the exterior walkaround.*

The exterior walkaround ensures that the general condition of the aircraft is satisfactory and that the visible aircraft components and equipment are safe for the flight:
- There is no impact damage to the structure
- There is no evident fuel, oil, or hydraulic leak
- All ground access doors are closed.
- All covers are removed (e.g. pitot covers, AOA covers, etc.).
- Aircraft discrepancies will immediately be brought to the attention of the Pilot in command. The appropriate crewmember will notify maintenance and ground staff as necessary.

In case of ice and snow accumulated on the aircraft surfaces, the pilot in command of the aircraft must perform a complementary EXTERIOR WALKAROUND procedure.
The flight crew must perform a complete walkaround before each flight.
The parking brake must be set to ON during the exterior walkaround, in order to enable the flight crew to check brake wear indicators.

WARNING	If any landing gear door is open, do not apply hydraulic power until clearance is obtained from ground personnel.

EXTERIOR WALKAROUND

GENERAL

1 Ident.: PRO-NOR-SOP-06-20806618.9001001 / 02 MAY 23
Applicable to: ALL

Items marked by asterisks (*) are the only steps to be completed after a transit stop without flight crew change. Otherwise, the new flight crew performs all the items.
The PF and PM should perform the cockpit preparation, in accordance with the defined panel scan sequence and tasksharing.
The PF prepares the overhead panel, the center instrument panel and the pedestal while the PM performs the external walkaround. When both flight crewmembers are seated and the PM has checked the FMS, both flight crewmembers continue the cockpit preparation.

WARNING	Do not pressurize the hydraulic systems until clearance is obtained from ground personnel.

FLIGHT PLAN INITIALIZATION

* FLIGHT PLAN INITIALIZATION...COMPLETE | PF

L2
- *Press the INIT key*
- *Insert CO RTE or city pair, and check FROM/TO*
- *Check/modify ALTN/CO RTE*
- *Enter flight number*

Note: For ATC needs, the crew should enter exactly the entire flight number, as shown on the ICAO flight plan, without inserting any space, on the MCDU INIT page.

- *Enter (and/or check) cost index*
- *Enter intended initial CRZ FL, or check if it was already supplied by the database. Modify it, if necessary, taking into account ATC constraints or expected gross weight*
- *Check and modify CRZ FL TEMP and tropopause level to agree with forecast*
- *Enter (and/or check) the expected ground temperature for take off (GND TEMP)* ⊲
- *PRESS IRS INIT prompt*
- *Check alignment latitude/longitude.*

Ident.: PRO-NOR-SOP-06-D-00011232.0011001 / 02 MAY 23
Applicable to: MSN 01459, 02887

46 ADIRS POSITION INITIALIZATION

* ADIRS POSITION INITIALIZATION...AS APPROPRIATE | PF

L2 *Confirm or insert position coordinates for the IRS alignment. Refer to FCTM/PR-NP-SOP-60 FMGS Preparation.*

L1
- Between latitude 73 ° and 82 °, the IRS alignment should last at least 15 min.
  After the start of the IRS alignment procedure, wait 15 min. Then press the ALIGN IRS prompt.

Ident.: PRO-NOR-SOP-06-D-00011232.0001001 / 02 MAY 23
Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734, 02896-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11139

47 ADIRS POSITION INITIALIZATION

* ADIRS POSITION INITIALIZATION...AS APPROPRIATE | PF

L2 *Confirm or insert position coordinates for the IRS alignment. Refer to FCTM/PR-NP-SOP-60 FMGS Preparation.*

IRS Alignment Based on GPS ◁✲ Position available:

The position initialization is automatic. The position for the initialization of the IRS is the GPS position. However, the flight crew can manually override the automatic position initialization. The IRS crosschecks the flight crew's manual entry with the GPS position.

IRS Alignment Based on GPS ◁✲ Position not available:

Apply the manual position initialization procedure.

ACTIVE F-PLN CHECK

* F-PLN A page..COMPLETE AND CHECK | PF

L2 *If CO RTE has been inserted, the F-PLN should automatically include the preferential or probable takeoff runway approach and landing runway, associated SIDs, STARs, transition and en-route waypoints. However some databases will only include departure and arrival airport IDENTs and en-route waypoints.*

The flight crew must check, modify, or insert (as applicable) the F-PLN in the following order, according to the data given by ATIS, ATC, or MET:

- *Lateral revision at departure airport. Select RWY, then SID, then TRANS using scroll keys*

  Note: On the MCDU departure page, select only a runway associated with an ILS or NO NAVAIDS.

- *Lateral revision at WPT for ROUTE modification if needed. (Refer to 00010632 **Not found**)*
- *Vertical revision. Check or enter climb speed limit, constraints according to ATC clearance. Enter step altitude as appropriate.*

L1 * WINDS...AS APPROPRIATE | PF

L2 *Choose between using trip wind and the forecast wind for CLB, CRZ and DES phases.(Refer to 00011024 **Not found**).*

L1 * F-PLN.. CHECK | PF

L2
- *Check the F-PLN using F-PLN page and ND PLAN mode versus the computer (paper) flight plan or navigation chart*
- *Check DIST TO DEST along the F-PLN. Compare it with the total distance computed for the flight with the computer (paper) flight plan.*

49 Ident.: PRO-NOR-SOP-06-D-20806656.9001001 / 02 MAY 23
Applicable to: ALL

SECONDARY F-PLN

* SECONDARY FLIGHT PLAN...AS APPROPRIATE | PF

L2 *This is routinely a copy of the active flight plan. However, consideration may be given to the following:*

a. Copy the active F-PLN, but modify it at a suitable WPT for an immediate return to the departure airfield in the event of, for example, engine failure

b. If weather is below landings minima at the departure airfield, the secondary flight plan should be that required for a diversion immediately after takeoff

c. If there is a chance of a change in runway or SID during taxi, prepare for it by copying the active flight plan and making the necessary modifications.

50 Ident.: PRO-NOR-SOP-06-D-20806657.9001001 / 02 MAY 23
Applicable to: ALL

RADIO NAV

* RADIO NAV...CHECK | PF

L2
- *Check the VOR, ILS / GLS ◁ / MLS ◁ , and ADF ◁ tuned by the FMGC*
- *Modify them if required, and check that the correct identifier is displayed on the ND and PFD (VOR, ILS / GLS ◁ / MLS ◁). If unsatisfactory, go through the audio check. For GLS ◁ / MLS ◁ , no audio check is necessary.*

L1

CAUTION	Do not enter an IDENT or channel associated with a MLS ◁ .

Applicable to: ALL

GROSS WEIGHT INSERTION (INIT B PAGE);

* ZFW/ZFWCG.. INSERT | PF
* BLOCK FUEL...INSERT | PF

CAUTION	The characteristic speeds displayed on the MCDU (green dot, F, S, VLS) are computed from the ZFW and ZFWCG entered by the crew on the MCDU. Therefore, this data must be carefully checked (Captain’s responsibility).

- The flight crew should insert the weights after completing all other insertions. This is to avoid cycles of prediction computations at each change in flight plan, constraints, etc
- If ZFW and ZFWCG are unavailable, it is acceptable to enter the expected values in order to obtain predictions. Similarly, the flight crew may enter the expected fuel on board, if refueling has not been completed at that time
- If ZFW, ZFWCG, and BLOCK FUEL are inserted, the FMS will provide all predictions, as well as the EXTRA fuel, if any.

● **If the flight has been dispatched with operational tankering:**

FINAL/TIME..INSERT | PF

- The operational tankering fuel should be added to the FINAL/TIME fuel and inserted into the FINAL/TIME field.
- If ZFW, ZFWCG, FINAL/TIME and BLOCK FUEL are inserted, the FM will provide all predictions, as well as the actaul EXTRA fuel, if any.

52 Ident.: PRO-NOR-SOP-06-D-20806659.9001001 / 02 MAY 23
Applicable to: ALL

TAKEOFF DATA INSERTION (PERF TAKEOFF PAGE):

The PF inserts the takeoff data in the PERF TAKEOFF page of the MCDU.

* T.O SHIFT..INSERT AS RQRD | PF

L2 *If the aircraft takes off from an intersection, insert a T.O shift value (even when GPS PRIMARY is active) to increase flight crew awareness of the runway length reduction.*

L1 * V1, VR, V2..INSERT | PF
* FLX TO TEMP..INSERT | PF
* THR RED/ACC altitude..SET or CHECK | PF

The THR RED/ACC altitude must be checked on the EFB.

Note: *If EFB is inoperative or not available, the THR RED/ACC altitude must be checked on the ODM (Operational Data Manual).*

If a Noise Abatement Departure Procedure is in effect, the pilot must adjust the values according to the local regulations. If the ACC altitude is not specified, it must be of 3.000 ft AFE and the minimum THR RED altitude, if not specified, must be of 800 ft AFE (NADP 1).

* ENG OUT ACC altitude..SET or CHECK | PF

The ENG OUT ACC altitude must be checked on the EFB (minimum 1.500 ft AFE)

* FLAPS/THS reminder..INSERT | PF

The FLAPS reminder position must be checked against the TO CONF setting selected on the EFB.

L2 *The THS can be left black until the loadsheet is received. When entered in the MCDU, the THS value will be used to trigger the F/CTL PITCH TRIM/MCDU/CG DISAGREE ECAM caution, if appropriate.*

CLIMB, CRUISE, DESCENT, SPEED PRESELECTION

* PRESET SPEEDS.. AS RQRD | PF

L2 *If the flight is cleared for a close-in turn or close-in altitude constraint, the flight crew may preselect green dot speed on the PERF CLB page. Once the CLB phase is active, the preselected speed will be displayed in the FCU speed window and on the PFD (blue symbol). Once the turn is completed or the altitude cleared, the pilot will resume the managed speed profile by pressing the SPD selector on the FCU.*
Similarly the pilot may select a CRZ MACH number on the PERF CRZ page (constant CRZ Mach segment, for example). When the CRZ phase is active, the preselected CRZ MACH number will be displayed in the FCU speed window and on the PFD. When ECON MACH number may be resumed, the crew presses the FCU SPD selector.
In either of the above cases, the pilot may cancel the CLB or CRZ preselected SPD/MACH prior to activating the related phase, by selecting ECON on the PERF CLB or CRZ pages.
SPD LIM is defaulted to 250 kt below 10 000 ft in the managed speed profile. This may be either cleared or modified on the VERT REV page at the origin (or a climb waypoint).

CHECK OF FMGS PREPARATION:

* FMS PREPARATION.. CROSSCHECK | PM

L2 *After the PF prepares the FMS, the PM checks all the data entered in the FMS. This check includes a crosscheck between:*

- *Waypoints of the expected departure route that include constraints*
- *Waypoints of the flight plan and the computerized flight plan*
- *Initial cruise altitude and the computerized flight plan*

- *Total track miles and the computerized flight plan*
- *Fuel remaining at destination and the computerized flight plan*
- *Performance data displayed on the PM's EFB with the PERF TAKE OFF page. This includes modifications of the THR RED/ACCEL/EO ACCEL settings, if applicable*
- *TRANS ALT in the ACTIVE/PERF page*
- *Setup of the SEC flight plan.*

L1 L2 The PM should have the same mental image of the intended departure procedure, trajectory, and constraints as the PF. The PM should check with the PF if anything is not clear.

L1 * EFB/MCDU GREEN DOT..COMPARE | PM

L2 *The PM compares Green Dot speed computed by the FMGS and the Green Dot speed computed using the TAKEOFF application. A discrepancy indicates a difference in the TOW used in both systems (EFB/FMGS).*

OXYGEN MASK TEST

WARNING	To prevent hearing damage to the ground crew connected to the intercom system, inform them that a loud noise may be heard in the headset when performing the oxygen mask test.

- **On the OXYGEN panel:**

CREW SUPPLY pb	CHECK ON	PF-PM

- **On the glareshield:**

LOUDSPEAKERS	ON	PF-PM

- **On the audio control panel:**

INT reception knob	PRESS OUT-ADJUST	PF-PM
INT/RAD sw	INT	PF-PM

- **On the mask stowage box:**
  - Press and hold the reset/test pb in the direction of the arrow.
    - Check that the blinker turns yellow for a short time, and then goes black.
  - Hold the reset/test pb down, and press the emergency pressure selector.
    - Check that the blinker turns yellow and remains yellow, as long as the emergency pressure selector is pressed.
    - Listen for oxygen flow through the loudspeakers. Warn any engineer, whose headset may be connected to the nose intercom, that a loud noise may be heard when performing this check.

- Check that the reset/test pb returns to the up position and the N 100 % selector is in the 100 % position.
- Press the emergency pressure selector again, and check that the blinker does not turn yellow. This ensures that the mask is not supplied.

● **On the ECAM DOOR/OXY SD page:**
REGUL LO PR message........ CHECK OFF | PF-PM

Note: *The crew must perform this check after having checked all masks. It ensures that the LP valve is open, (due to residual pressure between the LP valve and the oxygen masks, an LP valve failed in the closed position may not be detected during the oxygen mask test).*

The Single Engine Taxi Without APU (SETWA) must be considered as the standard operating procedure when taxiing out the aircraft. This procedure must not be performed if any of the following situations apply:

- The aircraft has been dispatched with MEL items that affect operational procedures.
- Heavy gross weight.
- Slippery taxiways.
- Uphill slopes.
- Low visibility conditions.
- The use of Anti-Ice is required.
- APU is not working.
- Captain considers that the procedure will increase the workload and could have an impact on the flight safety.
- At airports where Pushback is not available and/or with reduced distances and space where jet blast can cause damage.
- If the Aircraft is not configured with Single Engine Taxi Without APU (SETWA), One Engine Taxi with APU may be considered with the above conditions.

AUTOMATIC ENGINE START

Ident.: TDU / PRO-NOR-SOP-08-00022757.0001001 / 02 MAY 23
Applicable to: MSN 08495-09324, 10949-11139
Impacted DU: 00010162 Automatic Engine Start

6
7

If, during the engine start, the ground crew reports a leak from the engine, abort the engine start sequence. Maintenance action is due before the flight.

THRUST levers...IDLE | PF

CAUTION	*The engines start regardless of the thrust lever position. If the thrust levers are not set to IDLE, then thrust rapidly increases to the corresponding thrust lever position, causing a hazardous situation.*

ENG MODE selector ....IGN/START | PF

The lower ECAM displays the ENG SD page. Depending on the engine thermal state, the FADEC can command an automatic dry cranking (engine cooling). In such case, when the ENG MODE selector is set to IGN/START, the indication COOLING is displayed on the E/WD for one, or both engines with the expected engine cooling time indicated. Refer to DSC-70-80-40 Engine Cooling

DUAL COOLING pb-sw ....AS RQRD | PF

The dual cooling function becomes available when the required cooling times of both engines is displayed: if dual cooling is required, wait until the indication COOLING is displayed for both engines before setting the DUAL COOLING pb-sw to ON. Setting the DUAL COOLING pb-sw to ON enables to arm the dual cooling function: When the ENG MASTER lever is set to ON, the FADEC commands an automatic dry cranking on both engines simultaneously (if cooling is required). This enhances the overall time to start the engines when cooling is required. When this function is armed, the memoDUAL COOLING is displayed on the E/WD.

ENGINE 1 START...ANNOUNCE | PF

L2 *Engine 1 will be started first as a Standard Procedure.*

L1

WARNING	Contact and Verify with ground personnel that surrounding area is cleared of ground equipment and personnel before starting the engines.

- **After all amber crosses and messages have disappeared on the engine parameters (upper ECAM display) and ENG SD page:**

  ENG 1 MASTER lever .... ON | PF

  Note:
  - *Parameter callouts are not mandatory.*
  - *In case the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM DUs), abort the start by setting to OFF the ENG 1 MASTER lever. Then, perform a 30 s dry crank.*
  - *When the FADEC detects an impending hot start or stall, the FADEC applies an automatic recovery sequence without an ECAM message. The flight crew notices that fuel will be commanded OFF, and then re-commanded ON. It is not necessary for the flight crew to shut down the engine.*

  Note: *If the DUAL COOLING function is armed, the cooling will be performed on both engines simultaneously. In such case, the FADEC resumes the start sequence of ENG 1 once the cooling time indication is at zero for both engines.*

ON ECAM UPPER DISPLAY	***ON ECAM LOWER DISPLAY***
N2 increases	*Corresponding start valve inline.* *Bleed pressure indication green.* *Oil pressure increases.*
At approximately 18 % N2: *- FF increases.*	*Indication of the active igniter (A or B).*
20 s (maximum) after fuel is on *- EGT increases* [1] *- N1 increases prior to 48 % N2.*	
At approximately 55 % N2	*Start valve crossline.* *Igniter indication off.*

(1) *After initial EGT increase during the start sequence, the EGT may drop slightly for a short period of time before increasing again. This EGT roll-back is a normal engine start behavior and does not require any maintenance action.*

- **When idle is reached (AVAIL indication is displayed):**

  ENG IDLE PARAMETERS...CHECK | PF

  At ISA sea level : *N1 about 19 %*
  N2 about 59 %
  EGT about 550 °C
  FF about 270 kg/h (600 lb/h)

  Immediately upon the start valve is fully closed, start Engine 2.

  ENGINE 2 START...ANNOUNCE | PF

ENG 2 MASTER lever .... ON | PF

Apply the same procedure as indicated for engine 1. Engine 2 powers the yellow hydraulic system, that pressurizes the parking brake.

Note:
- *If dual cooling has been selected for engine start, the FADEC keeps in memory the cooling benefit for ENG2 provided ENG 2 is started within 20 min after ENG 1 start. However, in any case, the FADEC commands an engine cooling before ENG 2 start.*
- *A PTU FAULT is triggered, if the last engine is started within 40 s following the end of the cargo doors operation. .Refer to PRO-ABN-HYD HYD PTU FAULT*

8

If, during the engine start, the ground crew reports a fuel leak from the engine drain mast, run the engine at idle for 5 min. If the leak disappears during these 5 min, the aircraft can be dispatched without maintenance action. If the leak is still present after 5 min, shut down the engine and request the maintenance personnel to investigate the leakage source.

THRUST levers...IDLE | PF

CAUTION	*The engines start regardless of the thrust lever position. If the thrust levers are not set to IDLE, then thrust rapidly increases to the corresponding thrust lever position, causing a hazardous situation.*

10 ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG 1 and 2 ANTI ICE pb-sw .... AS RQRD | PF

- *Turn on engine anti-ice during all ground operations, when icing conditions exist or are anticipated*
- *During ground operation, when in icing conditions and when the OAT is +3 °C or less, or if significant engine vibration occurs, the following procedure should be applied for ice shedding:*

L2

1. The flight crew must consider the taxi-in time from the previous flight and the taxi-out time of the current flight to determine the total taxi time.
2. If a maintenance task to de-ice the engines was performed before engine start, the taxi-in time of the previous flight must be disregarded.
3. For taxi-in time, Refer to PRO-NOR-SOP-22 Parking - Logbook.

L1

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should set parking brake to ON or brake with pedals and accelerate the engines to minimum 60 % of N1.

Engine accelerations should be performed at intervals not greater than:
- *30 min if OAT is at +3 °C or below but above -9 °C*
- *120 min if OAT is at -9 °C or below.*

There is no requirement to maintain the high thrust settings.
In addition, this engine acceleration should also be performed just before take-off, with particular attention to engine parameters to ensure normal engine operation.
If the ground surface conditions or the environment do not permit, the flight crew must request maintenance action for manual engine deicing.

11 ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG 1 and 2 ANTI ICE pb-sw .... AS RQRD | PF

- *Turn on engine anti-ice during all ground operations, when icing conditions exist or are anticipated.*
- *During ground operation, when in icing conditions and the OAT is +3 °C or less, or if significant engine vibration occurs, the following procedure should be applied for ice shedding:*

L2 *Note:* 1. *The flight crew must consider the taxi-in time from the previous flight and the taxi-out time of the current flight to determine the total taxi time.*
2. *If a maintenance task to de-ice the engines was performed before engine start, the taxi-in time of the previous flight must be disregarded.*
3. *For taxi-in time, Refer to PRO-NOR-SOP-22 Parking - Logbook.*

L1

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should set parking brake to ON or brake with pedals and accelerate the engines to minimum 50 % of N1 at intervals not greater than 15 min. There is no requirement to maintain the high trust settings. In addition, this engine acceleration should also be performed just before take-off, with particular attention to engine parameters to ensure normal engine operation.

Note: *When performing the static run-up, the 61-74 % N1 range should be avoided.*

- *If ENG ANTI ICE pb-sw is set to ON and the valve(s) do not open (FAULT light(s) remain on), increase the N2 of the associated engine by about 5 %.*
  When the valves are open, retard the thrust lever(s) to IDLE.
- *If ENG ANTI ICE pb-sw is set to ON, the IGNITION memo appears on the ECAM because continuous ignition is automatically selected.*

ANTI ICE

CAUTION	In icing conditions (Refer to LIM-ICE_RAIN Definition of Icing Conditions), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG 1 and 2 ANTI ICE pb-sw .... AS RQRD | PF

- *Turn on engine anti-ice during all ground operation, when icing conditions exist or are anticipated.*
- *During ground operation, when in icing conditions and the OAT is +3 °C or less for more than 30 min, or if significant engine vibration occurs, the following procedure should be applied for ice shedding:*

L2 *Note:* 1. *The flight crew must consider the taxi-in time from the previous flight and the taxi-out time of the current flight to determine the total taxi time.*
2. *If a maintenance task to de-ice the engines was performed before engine start, the taxi-in time of the previous flight must be disregarded.*
3. *For taxi-in time, Refer to PRO-NOR-SOP-22 Parking - Logbook.*

L1

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should set parking brake to ON or brake with pedals and accelerate the engines to approximately 70 % of N1 for 30 s at intervals not greater than 30 min.
In addition, this engine acceleration should also be performed just before take-off, with particular attention to engine parameters to ensure normal engine operation. If ground surface or environment do not permit to accelerate the engine to 70 % N1, then power setting and dwell time should be as high as practical.
When operating in conditions of freezing rain, freezing drizzle, freezing fog or heavy snow, ice shedding may be enhanced, by additional run ups at intervals, to not exceed 10 min, advancing throttles to 70 % N1 momentarily (no hold time).

FINAL CHECK

T.O CONFIG pb ....TEST | PM

L2 *Press the T.O CONFIG pb on the ECP, and check that the EWD displays the T.O CONFIG NORMAL memo.*

L1 T.O MEMO..CHECK NO BLUE | PM

L2 *Check that the EWD does not display any blue line in the T.O memo section.*

L1 CABIN REPORT..RECEIVE | PF-PM

L2 *Check CABIN READY ⊲✱ in the EWD, or obtain the cabin report from the purser.*

25 Ident.: PRO-NOR-SOP-10-A-20806726.9001001 / 02 MAY 23
Applicable to: ALL

CHECK TECHNIQUE NOTE:

The FLAPS SETTING Item should be confirmed by both pilots according to the following check technique:

FLAP SETTING...CONF___(BOTH) | PF-PM

The PF checks and compares the flaps setting on the EWD and FMS PERF page.

The PF announces the configuration displayed on EWD and FMS PERF page, e.g. “CONF 1+F, CONF 1+F”
The PM checks and compares the flaps setting on the EWD and EFB.
The PM announces the configuration displayed on EWD and EFB, e.g. “CONF 1+F, CONF 1+F”

TAXI CHECKLIST

TAXI C/L..COMPLETE | PF-PM

DEPARTURE CHANGE

DEPARTURE CHANGE

	FINAL TAKEOFF PERF DATA.................RECOMPUTE		PF-PM
L2	*The PF and the PM independently compute again the takeoff performance data.*		
L1	FMS TAKEOFF DATA.................REVISE		PM
L2	*The PM revises the takeoff data in the FMS.* *If the flight crew uses the optimum configuration option for the computation, they should pay specific attention to changes to the configuration of the slats/flaps at takeoff.*		
L1	FMS REVISED TAKEOFF PERF DATA.................CROSSCHECK		PF
L2	*The PF crosschecks the performance data displayed on the PF's EFB with the FMS PERF T.O page.*		
L1	EFB/MCDU GREEN DOT.................COMPARE		PF
L2	*The PF compares Green Dot speed computed by the FMGS and the Green Dot speed computed using the TAKEOFF application. A discrepancy indicates a difference in the TOW used in both systems (EFB/FMGS).*		
L1	FLAPS lever ....AS APPROPRIATE		PM
L2	*Select takeoff position.*		
L1	F-PLN (SID,TRANS).................CHECK		PM
L2	*Carefully confirm that the ATC clearance agrees with the FMS, if NAV mode is to be used.*		
L1	INITIAL CLIMB SPEED AND SPEED LIMIT.................CHECK		PM
L2	*Use VERT REV at departure, or at a CLB waypoint.*		
L1	RE-BRIEFING.................COMPLETE		BOTH
	DEPARTURE CHANGE C/L.................COMPLETE		PF-PM

CHECK TECHNIQUE NOTE:

The FLAPS SETTING Item should be confirmed by both pilots according to the following check technique:

FLAP SETTING.................CONF___(BOTH) | PF-PM

The PF checks and compares the flaps setting on the EWD and FMS PERF page.
The PF announces the configuration displayed on EWD and FMS PERF page, e.g. "CONF 1+F, CONF 1+F"
The PM checks and compares the flaps setting on the EWD and EFB.
The PM announces the configuration displayed on EWD and EFB, e.g. "CONF 1+F, CONF 1+F"

The T.O. SPEEDS & THRUST Item should be confirmed by both pilots according to the following check technique:

T.O. SPEEDS & THRUST...______(BOTH) | PF-PM

The PF reads aloud V1, VR, V2 and thrust setting on the FMS PERF page, e.g. "V1 One Two Five, VR One Two Five, V2 One Two Nine, Flex Fifty Two".
The PM reads aloud V1, VR, V2 and thrust setting on the EFB, e.g. "V1 One Two Five, VR One Two Five, V2 One Two Nine, Flex Fifty Two".

Applicable to: ALL

PACKS

PACK 1 pb-sw and PACK 2 pb-sw .... AS RQRD | PM

L2 *Consider selecting packs OFF.*
This will improve performance when using TOGA thrust.
In the case of a FLEX takeoff, selecting packs OFF or APU bleed ON will reduce takeoff EGT, and thus reduce maintenance costs.
The use of FLEX thrust may reduce maintenance costs. The effect is particularly significant with the first degrees of FLEX.
Use of APU bleed is not authorized, if wing anti-ice is to be used.

Note: Consider specific procedures for both PACKS OFF when operating in high altitude airport or when flight was dispatched with system related MEL items inoperative.

3 THRUST SETTING

The below procedure is the standard takeoff procedure. However, rolling takeoff is permitted.

TAKEOFF	ANNOUNCE	PF
THRUST	50 % N1 (1.05 EPR)	PF

- **If the crosswind is at or below 20 kt and there is no tailwind:**

SIDESTICK	HALF FORWARD	PF

L2 *To counter the nose-up effect of setting engine takeoff thrust, apply half forward sidestick until the airspeed reaches 80 kt. Release the sidestick gradually to reach neutral at 100 kt.*

L1

BRAKES	RELEASE	PF
THRUST LEVERS	FLX or TOGA	PF

L2 *Once the thrust levers are set to FLX or TOGA detent, the Captain maintains the hand on the thrust levers until the aircraft reaches V1.*

L1

- **In the case of tailwind, or if crosswind is above 20 kt:**

SIDESTICK	FULL FORWARD	PF

L2 *To counter the nose-up effect of setting engine takeoff thrust, apply full forward sidestick until the airspeed reaches 80 kt. Release the sidestick gradually to reach neutral at 100 kt.*

L1

BRAKES	RELEASE	PF

THRUST LEVERS.......... FLX or TOGA | PF

L2
- *Increase thrust progressively to reach takeoff thrust by 40 kt ground speed*
- *Once the thrust levers are set to FLX or TOGA detent, the Captain maintains the hand on the thrust levers until the aircraft reaches V1.*

L1

Note: *1. ENG SD page replaces WHEEL SD page on the ECAM lower display*
2. The FADEC includes a keep-out zone, which is designed to avoid steady state operation inside a N1 range between 60 % and 74 % due to fan flutter phenomenon. This can result in discontinuous EPR increase during thrust setting (Refer to DSC-70-20 Functions).

CHRONO.......... START | PM
DIRECTIONAL CONTROL.......... USE RUDDER | PF

L2 *At 130 kt (wheel speed), the connection between nosewheel steering and the rudder pedals is removed. Therefore, in strong crosswinds, more rudder input will be required at this point to prevent the aircraft from turning into the wind.*

L1 PFD/ND.......... MONITOR | PM

L2 *If GPS PRIMARY LOST, check on the ND the FMS position: i.e. that the aircraft is on the runway centerline.*

4 THRUST SETTING

The below procedure is the standard takeoff procedure. However, rolling takeoff is permitted.

TAKEOFF.......... ANNOUNCE | PF
THRUST.......... 50 % N1 (1.05 EPR) | PF

- **If the crosswind is at or below 20 kt and there is no tailwind:**

SIDESTICK.......... HALF FORWARD | PF

L2 *To counter the nose-up effect of setting engine takeoff thrust, apply half forward sidestick until the airspeed reaches 80 kt. Release the sidestick gradually to reach neutral at 100 kt.*

L1
BRAKES.......... RELEASE | PF
THRUST LEVERS.......... FLX or TOGA | PF

L2 *Once the thrust levers are set to FLX or TOGA detent, the Captain maintains the hand on the thrust levers until the aircraft reaches V1.*

L1 ● **In the case of tailwind, or if crosswind is above 20 kt:**

SIDESTICK........FULL FORWARD | PF

L2 *To counter the nose-up effect of setting engine takeoff thrust, apply full forward sidestick until the airspeed reaches 80 kt. Release the sidestick gradually to reach neutral at 100 kt.*

L1 BRAKES........RELEASE | PF
THRUST LEVERS........FLX or TOGA | PF

L2
- *Increase thrust rapidly to about 70 % N1 (1.15 EPR) then progressively to reach takeoff thrust by 40 kt ground speed*
- *Once the thrust levers are set to FLX or TOGA detent, the Captain maintains the hand on the thrust levers until the aircraft reaches V1.*

L1 *Note: ENG SD page replaces WHEEL SD page on the ECAM lower display.*

CHRONO........START | PM
DIRECTIONAL CONTROL........USE RUDDER | PF

L2 *At 130 kt (wheel speed), the connection between nosewheel steering and the rudder pedals is removed. Therefore, in strong crosswinds, more rudder input will be required at this point to prevent the aircraft from turning into the wind.*

L1 PFD/ND........MONITOR | PM

L2 *If GPS PRIMARY LOST, check on the ND the FMS position: i.e. that the aircraft is on the runway centerline.*

5 ANTI ICE

ENG ANTI-ICE pb-sw .... AS RQRD | PM

L2 *Engine anti-ice must be set to ON when icing conditions (Refer to LIM-ICE_RAIN Definition of Icing Conditions) exist or are anticipated, except during climb and cruise when the SAT is below -40 °C (-40 °F).*

L1 WING ANTI-ICE pb-sw .... AS RQRD | PM

L2 *When icing conditions are encountered:*

- *The flight crew may turn on the wing anti-ice to prevent ice accretion on the wing leading edge*
- *The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicator, or on the wipers, or with the SEVERE ICE DETECTED alert. This is to remove any ice accumulation from the wing leading edge.*

CLIMB

1 Ident.: PRO-NOR-SOP-14-A-20806757.9001001 / 02 MAY 23
Applicable to: ALL

INITIAL CLIMB

Normal vertical mode is CLB or OP CLB with managed speed active.

PF MCDU...PERF CLB | PF

L2
- *PF MCDU should be showing the PERF CLB page (allowing PF to monitor when the aircraft will reach the FCU selected altitude) but the flight crew may select other pages such as F-PLN page as may be tactically necessary*
- *The PROG page displays OPT FL and MAX REC FL. It is worth noting that this OPT FL is a function of the cost index (CI).*
- *The displayed MAX REC FL gives the aircraft at least a 0.3 g buffet margin. The flight crew may enter a cruise flight level above this level into the MCDU and the FMGS will accept it, provided that it does not exceed the level at which the margin is reduced to 0.2 g.*

L1 PM MCDU...F-PLN | PM

L2 *PM MCDU should be showing the F-PLN page (allowing the flight crew to enter any ATC long-term revisions to the lateral or vertical flight plan).*

L1

CLIMB SPEED MODIFICATIONS

- **If ATC, turbulence or operational considerations lead to a speed change:**

  Select the new speed with FCU SPD knob and pull.

  Speed target is now “selected”.

  To return to managed speed mode, push FCU SPD knob.

  The speed target is now “managed”.

  Note: *The best speed (and rate of climb) for long-term situations lies between green dot speed and ECON speed. At high altitude, acceleration from green dot to ECON speed can take a long time.*

EXPEDITE CLIMB

- **If ATC requires a rapid climb through a particular level:**

  Push the EXP pb on the FCU.

  The target speed is now green dot speed. FMA: THR CLB/EXP CLB/NAV.

Note: *Use EXP ◁ only for short-term tactical situations. For the best overall economy fly at ECON IAS.*

To return to ECON CLB speed:
Push ALT knob
Check FMA: THR CLB/CLB/ : DoneNAV.

Impacted DU: 00025005

3
AT THE TRANSITION ALTITUDE

BAROMETRIC REFERENCE.. SET STD/CROSSCHECK | PF-PM

L2
- *At the transition altitude, the barometric setting flashes on the PFD. The flight crew should set STD on the EFIS CP and on the standby altimeter.*
- *Crosscheck the barometric settings and the altitude indications.*

L1 *Note:* *When STD is set on the EFIS control panel, the transponder does not transmit to the Air Traffic Control (ATC) the standard barometric reference but the last QNH or QFE previously selected. The transmitted aircraft altitude is not affected. Only the FCU selected altitude, if used by the ATC, may be misinterpreted.*
Upon ATC notification of an incorrect barometric reference value, the flight crew can select manually a barometric reference of 1 013 hPa and set again STD on the EFIS control panel.

4 Ident.: PRO-NOR-SOP-14-A-20806760.9001001 / 02 MAY 23
Applicable to: ALL

CLIMB

CRZ FL.. SET AS RQRD | PF

L2
- *If ATC clears the aircraft to its intended CRZ FL or above, there is no need to modify the CRZ FL entered in the INIT A page during cockpit preparation. The MCDU will automatically take into account a higher CRZ FL selected with the FCU ALT knob.*
- *If ATC limits CRZ FL to a lower level than the one entered in the INIT A page (or present on the PROG page) the flight crew must insert this lower CRZ FL in the PROG page.*
  Otherwise there is no transition into CRZ phase: the managed speed targets and Mach are not modified, and SOFT ALT mode is not available. In that case, the FMA will display: MACH/ALT/NAV instead of MACH/ALT CRZ/NAV.

6 RADAR.. ADJUST AS APPROPRIATE | PF

Gain must be manually set to +4, when MULTISCAN sw is set to AUTO and when flying below FL 200.

Note:
1. *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt until displaying ground echoes.*
2. *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique.*
3. *In particular below FL 200, for situations with low-level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to Manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display.*
4. *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and Manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

FLIGHT PROGRESS

FLIGHT PROGRESS	CHECK	PF-PM

Monitor flight progress in the conventional way.

WHEN OVERFLYING A MANUALLY ENTERED WAYPOINT

- Check track and distance to the next waypoint
- Check the wind and update it if the current wind is significantly different.

WHEN OVERFLYING THE WAYPOINT, OR AT LEAST EVERY 30 MIN

Check FUEL:
- Check FOB (ECAM) and fuel prediction (FMGC), and compare with the computerized flight or use the performance application of the EFB
- Check that there is no fuel leak
- Check that the sum of the fuel on board and the fuel used is consistent with the fuel on board at departure:
  - If the value is abnormally negative, suspect a fuel leak
  - If the value is abnormally positive, suspect a fuel quantity overread.

CAUTION	This check must also be performed each time a FUEL IMBALANCE procedure is necessary. Perform the check before applying the FUEL IMBALANCE procedure. If a fuel leak is confirmed, apply the FUEL LEAK procedure.

NAVIGATION ACCURACY

● **If GPS PRIMARY LOST:**
NAV ACCURACY....................MONITOR | PF-PM

L2 *Monitor the navigation accuracy, particularly if any of the following occurs:*
- *IRS only navigation*
- *The PROG page displays LOW accuracy*
- *The NAV ACCUR DOWNGRAD message appears on the MCDU.*

*Refer to 00010499 **Not found**.*

L1 *Note:* *Methods for checking accuracy:*

- ***If the check is positive (error ≤ 3 N.m): FM position is reliable.***
  Use ND (ARC or NAV) and managed lateral guidance.
- ***If the check is negative (error > 3 N.m): FM position is not reliable.***
  Use raw data for navigation and monitor it.
  - ***If there is a significant mismatch between the display and the real position:***
    Disengage MANAGED NAV mode and use raw data navigation (possibly switching to ROSE VOR, so as not to be misled by FM data).

FMS

ARRIVAL page....................COMPLETE/CHECK | PF

L2 *Insert APPR, STAR, APPR VIA and TRANS if applicable. (Access by lateral revision at destination.)*

L1 F-PLN A page....................CHECK | PF

L2
- *Check that the F-PLN agrees with the planned approach and missed approach*
- *Check the F-PLN (approach and Missed Approach tracks and distances) vs. the approach charts, using the ND in PLAN mode as necessary*
- *Check speed constraints. Add new speed constraints if required.*

- *Check altitude constraints. Add new altitude constraints if required.*

  Note: *The FMS may have deleted the altitude constraints that are at or above the CRZ FL, or at or above any previous lower CRZ FL in the case of step climbs (Refer to 00012689 **Not found**).*

  In that case,
  - *Insert again the affected procedures (STAR, APPR VIA or TRANS)*
    The FMS keeps the altitude constraints that are below the CRZ FL, and deletes again the altitude constraints that are above current CRZ FL. The FMS may also delete the altitude constraints that are at current CRZ FL, and the altitude constraint windows that have a constraint at or above current CRZ FL.
  - *Manually enter the altitude constraints that are below current CRZ FL using the MCDU Vertical Revision pages.*
    It is not possible to enter an altitude constraint at the CRZ FL.
    In the case of an "AT" or "AT OR ABOVE" altitude constraint at the CRZ FL, the flight crew must select the DES mode only after the aircraft reaches the position of the altitude constraint to prevent an early descent.

- *In all cases, do not modify the final approach (FAF to runway or MAP), including altitude constraints*
- *Identify the position and the altitude of Final Descent Point (FDP) and check the value of the FPA after this FDP*
- *If a TOO STEEP PATH message is displayed after the FDP, do not use FINAL APP guidance for approach*
- *Identify the Missed Approach Point.*

7 PERF APPR page..COMPLETE/CHECK | PF

- *Enter the QNH, temperature, and wind at destination.*

CAUTION	*During QFE operations, the flight crew must convert QFE into QNH. The CPC uses the QNH to compute the cabin pressurization profile. Therefore, the entry of QFE in QNH field of the PERF APPR page leads to an erroneous cabin pressurization profile.*

L12

Note: Insert the average wind given by the ATC or ATIS. Do not insert the gust value. During approach, the Ground Speed Mini function (managed speed mode) takes into account the instantaneous gust.
For more information, Refer to Ground Speed Mini Function.
For example, if the wind is 15020G35KT, insert 150/20.

- *Insert the minimum.*

Note: For any Non Precision Approach the minima (MDA) must be added by 50 ft (Derived Decision Altitude = MDA + 50 ft)

CAUTION	*If the QNH altimeter setting is used for an aircraft with the QFE option ◁ , Refer to DSC-22_20-85 QNH Use for Aircraft Equipped with QFE Option.*

Note: Changing the RWY or the type of approach automatically erases the previous minimum.

Note: After the activation of the SEC F-PLN, check the VAPP, and modify if necessary.

- *Check or modify the landing configuration. Always select the landing configuration on the PERF APPR page: CONF FULL is the normal landing configuration. CONF 3 should be considered, depending on the available runway length and go-around performance, or if windshear/severe turbulence is considered possible during approach.*
  If the forecasted tailwind at landing is more than 10 kt, Refer to LIM-AG-OPS Tailwind Landing for the recommended/required landing configuration.
- *Check or modify the transition altitude/flight level.*

PREFERENTIAL SETTING FOR LANDING

SETTING	RWY CONDITION	REVERSERS	FLAPS	AUTOBRAKE
A	Dry Only / WET(1)	Idle	CONF 3	LO
B	Dry Only / WET(1)	Idle	CONF FULL	LO
C	Dry Only / WET(1)	Idle	CONF FULL	MED
D	ALL(2)	Max	CONF FULL	MED
E	ALL	Max	CONF FULL	MANUAL

(1) *On WET runways (runways surface condition GOOD/RWYCC 5 minimum only), the flight crew may select REV IDLE, if the following conditions are satisfied:*
- *A landing distance assessment has been made with the following parameters:*
  - *MEDIUM TO POOR (RWYCC 2) landing performance level for the in-flight landing distance computation*
  - *NO reverser credit*
- *The result of this landing distance assessment is within the 15 % of LDA margin.*

(2) *On contaminated runway or runway condition GOOD to MEDIUM (RWYCC 4) until MEDIUM (RWYCC 3) the configuration must be: REV MAX, CONF FULL and autobrake MED (Setting D)*

Note: *Landing configuration must be selected from setting A down toward to E until the 15 % of margin is reached.*

Note: *Due to operational reasons the use of CONF 3 is allowed with any combination of AUTOBRAKE and REV setting.*

Note: *If the weather conditions are expected to change at the landing airport, or in the event of significant precipitation, the flight crew should consider a second calculation of the in-flight landing distance with the worst possible runway condition.*

CAUTION CONF 3 should not be used if one or more of the following conditions apply:
- The glide path angle or PAPI is equal or greater than 3,5 °.
- A Low Visibility Procedure is in effect (below CAT I minimums)
- The information used for landing performance calculation indicates tailwind
- Reported braking action is GOOD to MEDIUM (RWYCC 4) or MEDIUM (RWYCC 3)

CAUTION REV IDLE is the desired reverse thrust configuration to be used in normal operations.

REV MAX must be used if one or more of the following conditions apply:
- Reported braking action is GOOD to MEDIUM (RWYCC 4) or MEDIUM (RWYCC3)
- The information used for landing performance calculation indicates tailwind greater than 5 Kt

Note: *During automatic rollout with one thrust reverser inoperative, the flight crew can use the remaining thrust reverser, provided no more than idle thrust is used.*

In case preferential setting E is selected, additional restrictions must be followed:
- Pilots should select AUTOBRAKE MED and at touchdown apply MAX MANUAL BRAKING
- Captains operations or captain under training according to instructor criteria
- Maximum crosswind of 10 kt
- Maximum tailwind of 10 kt
- Operation with heavy rain, contaminated runway or runway slippery when wet (MEDIUM (RWYCC 3)) not allowed
- Additional restrictions published by the company.

In addition, the flight crew must select REV MAX if any of the following occurs at any time during the landing:
- An emergency
- The deceleration is not as expected
- A failure affects the landing performance
- A long flare or a long touchdown
- An unexpected tailwind.

27 ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG 1 and 2 ANTI-ICE pb-sw ....AS RQRD | PM

L2 *Engine anti-ice must be set to ON before and during descent, even If the SAT is below -40 °C (-40 °F).*
When ENG ANTI ICE is ON, the FADEC automatically controls continuous ignition and selects a higher idle thrust which gives better protection against flame-out. The IGNITION memo appears on the ECAM.

L1 WING ANTI ICE pb-sw ....AS RQRD | PM

L2 *When icing conditions are encountered:*
- *The flight crew may turn on the wing anti-ice to prevent the ice accretion on the wing leading edge*
- *The flight crew must turn on the wing anti-ice if there is evidence of ice accretion, such as ice on the visual indicators, or on the wipers, or with the SEVERE ICE DETECTED ◁ alert. This is to remove any ice accumulation on the wing leading edge.*

ANTI ICE ON reduces the descent path angle (when the engines are at idle). The flight crew can compensate for this by increasing the descent speed, or by extending up to half speedbrakes.

Ident.: PRO-NOR-SOP-16-A-00011558.0004001 / 02 MAY 23

Applicable to: ALL

DESCENT CLEARANCE

DESCENT CLEARANCE........OBTAIN | PM
CLEARED ALTITUDE ON FCU........ SET | PF

L2 *When the flight crew obtains the ATC clearance, they should set the cleared altitude (FL) on the FCU taking into account the safe altitudes.*
If the lowest safe altitude is above the cleared altitude, check with the ATC to determine if this constraint applies.
If the ATC confirms that this constraint applies, set the safe altitude on the FCU until it is safe to reach the cleared altitude.

DESCENT INITIATION

1 Ident.: PRO-NOR-SOP-17-20806796.9001001 / 02 MAY 23
Applicable to: ALL

DESCENT INITIATION

DESCENT.. INITIATE | PF

L2 The standard method to initiate the descent is to engage the DES mode at the T/D computed by the FMS.

L1 For more information on T/D and profile computation, *Refer to FCTM/00018923 **Not found***.

- **If ATC requires an early descent:**

  Use the DES mode.

  The DES mode guides the aircraft down to a lower vertical speed, in order to converge with the required descent path (the flight crew may use a V/S of 1 000 ft/min).

- **If ATC delays the descent:**

  Beyond the T/D, the T/D REACHED or DECELERATE message appears on the PFD and MCDU. This suggests that the flight crew should reduce the speed toward Green Dot speed with ATC permission.

  When cleared for descent, engage DES mode with the managed speed active.

DESCENT MONITORING

2 Ident.: PRO-NOR-SOP-17-20806797.9001001 / 02 MAY 23
Applicable to: ALL

DESCENT MONITORING

PF MCDU.. PROG/PERF DES | PF

L2 *PF MCDU should be set to PROG or PERF DES page:*
- *PROG page in order to get VDEV or RQD DIST TO LAND/DIRECT DIST TO DEST information*
- *PERF DES page in order to get predictions down to any inserted altitude in DES/OP DES modes and EXP mode .*

L1 PM MCDU.. F-PLN | PM
DESCENT.. MONITOR/ADJUST | PF

L2 *Refer to 00004008 **Not found**.*

- *When flying in NAV mode, use the DES mode*
  - *Monitor the VERT DEV*
    The VERT DEV appears on the PFD and on the PROG page.
  - *Monitor the FMA when the aircraft reaches the level-off symbol (i.e. ↘→ or) ↘→*

    Note: *The NDs display a level-off symbol ↘→ along the flight path. The position of this symbol is based on the current active modes: i.e. AP/FD and A/THR.*
    MCDU predictions assume a return to the lateral F-PLN and descent flight path.
    Note that whenever the lateral mode is changed from NAV to HDG/TRK the vertical mode reverts to V/S at the value pertaining at the time of the mode change.
  - *Monitor the predicted descent point after the next level-off.*
- *From time to time during stabilized descent, the flight crew may select FPA to check that the remaining distance to destination is approximately the altitude change required divided by the FPA in degrees*
- *FPA (°) = ΔFL/DIST (NM).*

DESCENT ADJUSTMENT

Applicable to: ALL

3 Ident.: PRO-NOR-SOP-17-A-20806798.9001001 / 02 MAY 23

DESCENT ADJUSTMENT

RATE of DESCENT...ADJUST, AS RQRD | PF

L2 To increase the rate of descent, increase the descent speed by using the selected speed, if comfort and the ATC permit. It is more cost-effective (Time/Fuel) than using the speed brakes:

- Maintain a high speed as long as possible, provided that the ATC permits to fly above the speed limits
- If the aircraft is high and at high speed, it is more efficient to keep the high speed until ALT* then to decelerate at level-off, instead of combining descent and deceleration
- If the aircraft goes below the desired profile, use the selected speed and the V/S mode to adjust the rate of descent.

In the OP DES mode, the flight crew can use the speed brakes to increase the rate of descent. The flight crew can also use the speed brakes to maintain the required rate of descent, when engine anti-ice is used.
In the DES mode, if the aircraft is on, or below the flight path and the ATC requires a higher rate of descent, do not use the speed brakes because the rate of descent is imposed by the planned

flight path. Therefore, the A/THR may increase thrust to compensate for the increase in drag. In this case, use the OP DES mode with speed brakes.

4 Ident.: PRO-NOR-SOP-17-A-20806799.9001001 / 02 MAY 23

TERRAIN ON ND

TERR ON ND..AS RQRD | PF-PM

	Guidance Modes per Approach Types				
	LOC G/S	**FINAL APP**	**LOC FPA**	**NAV FPA**	**TRK FPA**
RNP or RNAV(GNSS) with LNAV/VNAV minima	N/A	*Refer to APPR using FINAL APP*	N/A	Not Authorized	Not Authorized
RNP or RNAV(GNSS) with LNAV minima	N/A	*Refer to APPR using FINAL APP* (1)	N/A	*Refer to APPR using FPA Guidance*	Not Authorized
RNP or RNAV(GNSS) with LPV minima	N/A	Not Authorized	N/A	Not Authorized	Not Authorized
VOR VOR-DME NDB NDB-DME	N/A	*Refer to APPR using FINAL APP* (1)	N/A	*Refer to APPR using FPA Guidance*	*Refer to APPR using FPA Guidance*

(1) *The FINAL APP is the recommended guidance mode for this type of approach.*

For Visual Approach, *Refer to Visual Approach*
For Circling Approach, *Refer to Circling Approach*

Note: *The names of the approach and departure charts evolve. For convenience purposes the Cross-Reference table provides both names.*
RNP is equivalent to RNAV(GNSS).

* According to ICAO, instrument approach procedures are classified as follows:

- Non-precision approach (NPA) procedure:
  An instrument approach procedure which utilizes lateral guidance but does not utilize vertical guidance.
- Approach procedure with vertical guidance (APV):
  An instrument approach based on a navigation system that is not required to meet the precision approach standards of ICAO Annex 10 but provides course and glide path deviation information (sometimes referred to as “semi-precision”). Baro-VNAV, LDA with glide path, LNAV/VNAV and LPV are examples of APV approaches.
- Precision approach (PA) procedure:
  An instrument approach procedure using precision lateral and vertical guidance with minima as determined by the category of operation.

Note: *Lateral and vertical guidance refers to the guidance provided either by:*
a. ground-based navigation aid; or
b. computer-generated navigation data.

FLYING REFERENCE

6 Ident.: PRO-NOR-SOP-18-A-20806808.9001001 / 02 MAY 23
Applicable to: ALL

Use the following recommended flying reference:

- In vertical managed modes: HDG-V/S reference associated with the FD crossbars
- In vertical selected modes: TRK-FPA reference associated with FPD.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-18-A-00014487.0001001 / 17 OCT 22
Applicable to: MSN 04827-04860

This stabilization criteria must be applied in all kinds of approaches: LOC G/S, FINAL APP, FPA GUIDANCE and VISUAL APPROACH.
The objective is to be stabilized on the final descent path at VAPP in the landing configuration, at 1 000 ft above airfield elevation (AFE) in either instrument or visual conditions, after continous deceleration on the glide slope.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:

- The aircraft is on the correct lateral and vertical flight path (this may be a straight or curved path, depending on the approach procedure in use);
- The aircraft is in the desired landing configuration (as defined on the approach briefing);
- Engine thrust is properly set, usually above idle, in order to maintain the target approach speed along the desired final approach path;
- IAS is between VApp and VApp +20 kt

Note: *Vapp = Target Speed on the PFD.*

- The descent rate does not exceed 1 000 ft/min;
- Landing Checklist completed (all items accomplished and checklist read);
- There is no excessive flight parameter deviation.

In case of all conditions above have been achieved, at 1 000 ft AFE the PM will callout "**ONE THOUSAND, STABILIZED**".
Unless the flight crew estimates that only small corrections are necessary to rectify minor deviations from stabilized conditions due, amongst others, to external perturbations, if the aircraft is not stabilized on the approach path in landing configuration at 1 000 ft AFE, or at any altitude below 1 000 ft AFE, the flight crew must initiate a go-around.
If a go-around is necessary, the PM will callout "**ONE THOUSAND, UNSTABILIZED GO AROUND**" and the PF will necessarily start the go-around procedure.

STABILIZATION CRITERIA

Ident.: PRO-NOR-SOP-18-A-00014487.0002001 / 02 MAY 23
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11139

This stabilization criteria must be applied in all kinds of approaches: LOC G/S, FINAL APP, FPA GUIDANCE and VISUAL APPROACH.
The objective is to be stabilized on the final descent path at VAPP in the landing configuration, at 1 000 ft above airfield elevation (AFE) in either instrument or visual conditions, after continous deceleration on the glide slope.

In order for the approach to be stabilized, all of the following conditions must be satisfied before, or at the stabilization height:

- The aircraft is on the correct lateral and vertical flight path (this may be a straight or curved path, depending on the approach procedure in use);
- The aircraft is in the desired landing configuration (as defined on the approach briefing);
- Engine thrust is properly set, usually above idle, in order to maintain the target approach speed along the desired final approach path;

- IAS is between VApp and VApp +20 kt

  Note: *Vapp = Target Speed on the PFD.*

- The descent rate does not exceed 1 000 ft/min;
- Landing Checklist completed (all items accomplished and checklist read);
- There is no excessive flight parameter deviation.

In case of all conditions above have been achieved, at 1 000 ft AFE the PM will callout **"ONE THOUSAND, STABILIZED"**.
Unless the flight crew estimates that only small corrections are necessary to rectify minor deviations from stabilized conditions due, amongst others, to external perturbations, if the aircraft is not stabilized on the approach path in landing configuration at 1 000 ft AFE, or at any altitude below 1 000 ft AFE, the flight crew must initiate a go-around.
If a go-around is necessary, the PM will callout **"ONE THOUSAND, UNSTABILIZED GO AROUND"** and the PF will necessarily start the go-around procedure.

Note: *If the predicted tailwind at landing is greater than 10 kt, decelerated approach is not permitted, and the aircraft speed should be stabilized at around VREF + 5 kt in final.*

APPROACH SPEED TECHNIQUE

7 Ident.: PRO-NOR-SOP-18-A-20806810.9001001 / 02 MAY 23
Applicable to: ALL

DECELERATED APPROACH

The decelerated approach with FD or AP/FD guidance is the standard flying technique for ILS / MLS ◁ / GLS ◁ approaches and approaches using FLS ◁, SLS ◁ or FINAL APP guidance.

EARLY STABILIZED APPROACH

Under certain circumstances, the flight crew may decide to reduce the speed down to VAPP in the landing configuration at the Final Descent Point (i.e. approach via selected guidance, high glide path angle, low altitude intermediate approach, etc.). In order to obtain a valuable deceleration pseudo waypoint and to ensure a timely deceleration, the flight crew should enter VAPP as a speed constraint at the Final Descent Point.

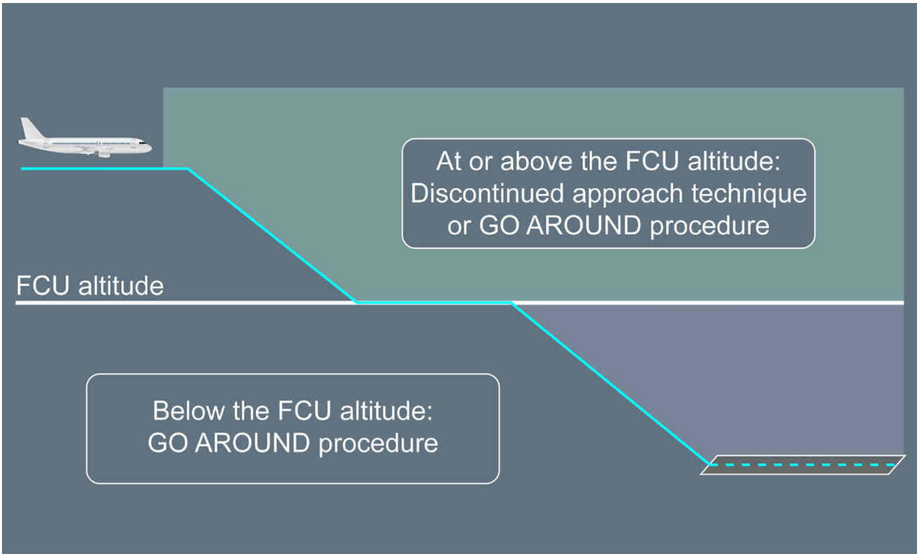
DISCONTINUED APPROACH

8 Ident.: PRO-NOR-SOP-18-A-20806811.9001001 / 02 MAY 23
Applicable to: ALL

In order to discontinue an approach when the aircraft is at or above the altitude selected on the FCU, the flight crew can either:

- Apply the GO AROUND procedure, or
- Apply the discontinued approach technique.

When the aircraft is below the FCU altitude, the flight crew must apply the GO AROUND procedure.



At or above the FCU altitude:
Discontinued approach technique
or GO AROUND procedure
FCU altitude
Below the FCU altitude:
GO AROUND procedure

- **If at or above the FCU altitude:**
  Announce "CANCEL APPROACH".
  To disarm any AP/FD approach mode, press APPR pb or LOC pb.

  Note: Valid only for ILS / MLS ◁ / GLS ◁ / FLS ◁ / SLS ◁ or FINAL APP guidance.

  Select lateral mode as required (NAV or HDG mode).
  Select vertical mode as required (level off or adjust V/S).
  Select SPEED and adjust.

- **If F-PLN has no destination anymore:**

  Perform a LAT REV at the last waypoint and redefine the destination in the NEW DEST field.

Note:
1. *The FMS does not automatically string the previous flown approach in the active F-PLN when the aircraft overflies the last waypoint. The FMS has no more destination in the F-PLN.*
2. *Because the thrust levers are not set to TOGA detent, the FMS remains in approach phase.*

Intentionally left blank

Aircraft Configuration Management

INITIAL APPROACH

1 Ident.: PRO-NOR-SOP-18-B-A-20806812.9001001 / 02 MAY 23
Applicable to: ALL

GENERAL

The initial approach procedure described here is a general guidance whatever the type of approach expected.

2 Ident.: PRO-NOR-SOP-18-B-A-20806813.9001001 / 02 MAY 23
Applicable to: ALL

INITIAL APPROACH

F-PLN SEQUENCING..................ADJUST | PF

L2
- *A good clue to monitor the proper F-PLN sequencing is the TO waypoint on the upper right side of the ND, which should remain meaningful*
- *In NAV mode, the F-PLN will sequence automatically*
- *In HDG or TRK mode, the F-PLN will sequence automatically only if the aircraft flies close to the F-PLN route.*

L1 APPROACH PHASE..................CHECK/ACTIVATE | BOTH

L2
- *If the aircraft overflies the DECEL pseudo waypoint in NAV mode, the APPR phase activates automatically*
- *If the aircraft is in HDG or TRK mode, approximately 15 NM from touchdown, activate and confirm APPR phase on the PERF DES page.*

L1 MANAGED SPEED..................CHECK | PF

L2 *If ATC requires a particular speed, use selected speed. When the ATC speed constraint no longer applies, return to managed speed.*

L1 FLIGHT PATH..................MONITOR | PF

L2
- *In NAV mode, use V/DEV information on the PFD and PROG page*
- *In HDG or TRK mode, use the energy circle on ND representing the required distance to land.*

L1 SPEED BRAKES lever .... AS RQRD | PF

L2 - *If the flight crew uses the speed brakes to increase the rate of deceleration or to increase the rate of descent, the VLS will increase as well:*
  - *The flight crew should ensure that appropriate speed margin exists before the extension of the speed brakes*
  - *If the speed brakes are extended, the flight crew should ensure that appropriate speed margin exists before the beginning of a turn.*

This will avoid the activation of the Alpha-Floor protection.

Note: *In clean configuration, the VLS with speed brakes fully extended may be more than Green Dot speed or VFE FLAP 1.*

Ident.: TDU / PRO-NOR-SOP-18-B-A-00014648.0002001 / 02 MAY 23

Impacted DU: 00014647

3 RADAR

RADAR..ADJUST AS APPROPRIATE | PF

L2
- *Gain must be manually set to +8 when MULTISCAN selector is set to AUTO and when flying below FL 150*
- *MULTISCAN AUTO mode provides an efficient ground clutter rejection. During operations in good or non significant weather conditions, no weather pattern will be displayed on the NDs. In this case, the flight crew confirms correct radar operation, using temporarily MANUAL TILT*
- *The flight crew monitors the weather radar display in AUTO mode, and confirms any weather display that is ambiguous or unexpected using manual tilt according to standard techniques.*

Ident.: TDU / PRO-NOR-SOP-18-B-A-00014648.0003001 / 02 MAY 23
Applicable to: MSN 02904-02924, 03211, 03391, 03658, 03761-03816, 04163, 04352-04544, 04570-04773, 04953-05987, 06097, 06121, 06139-07098
Impacted DU: 00014647

4 RADAR

RADAR..ADJUST AS APPROPRIATE | PF

L2
- *Gain must be manually set to +4 when MULTISCAN selector is set to AUTO and when flying below FL 200*
- *If the weather is good, or not significant, in order to check that the radar is operating correctly: down tilt under displaying ground echoes*
- *If the weather display is ambiguous or unexpected, in order to better analyze the weather situation, use manual tilt according to standard technique*

- *In particular below FL 200, for situations with low level weather, weather with low reflectivity or in front of suspected active cells, the flight crew should switch to manual mode and adjust the tilt setting downward until the weather is detected or the ground clutter appears on the upper part of the display*
- *In addition, the flight crew may increase the manual gain control to display lower reflectivity targets. The manual gain control can be increased in both AUTO and manual modes to display lower levels of weather. In both cases, ground clutter may also be displayed as a result of low settings and/or increased gain.*

5 Ident.: PRO-NOR-SOP-18-B-A-20806815.9001001 / 02 MAY 23
Applicable to: ALL

RADAR

RADAR....................................ADJUST AS APPROPRIATE | PF

6 Ident.: PRO-NOR-SOP-18-B-A-20806816.9001001 / 02 MAY 23
Applicable to: ALL

NAVIGATION ACCURACY

NAV ACCURACY....................................MONITOR | PM

L2
- *When GPS PRIMARY is available, no NAV ACCURACY monitoring is required*
- *If GPS PRIMARY LOST is displayed, or GPS not installed, check on PROG page that the required navigation accuracy is appropriate to the phase of flight*
- *If the accuracy is LOW, at least one ND must be in ROSE LS/VOR depending on the approach.*

INTERMEDIATE/FINAL APPROACH FOR ILS AND STRAIGHT-IN NON PRECISION APPROACHES

7 Ident.: PRO-NOR-SOP-18-B-C-20806817.9001001 / 02 MAY 23
Applicable to: ALL

GENERAL

The intermediate and final approach procedure described here is general guidance whatever the type of approach expected.

WING ANTI-ICE pb-sw	OFF	PM

- *Switch the WING ANTI ICE pb-sw to ON, only in severe icing conditions.*

SLIDING TABLE	STOW	PF-PM
LDG MEMO	CHECK NO BLUE	PM

- *The only exception is the CABIN READY ◁ line in flights without cabin crew.*

CABIN REPORT	RECEIVE	PF-PM

- *Obtain cabin report from the purser via one interphone buzzer sound or via CABIN READY MEMO.*

LANDING CHECKLIST	COMPLETE	PF-PM

FLIGHT PARAMETERS.......MONITOR		PM

- *The PF announces any FMA modification.*
- *The PM calls out, if:*
  - *The speed goes lower than the speed target -5 kt , or greater than the speed target +10 kt*
  - *The pitch attitude goes lower than -2.5 °, or greater than +10 ° nose up*
  - *The bank angle becomes greater than 7 °*
  - *The descent rate becomes greater than 1 000 ft/min*
- *Following PM flight parameter exceedance callout, the suitable PF response will be:*
  - *Acknowledge the PM callout, for proper crew coordination purposes*
  - *Take immediate corrective action to control the exceeded parameter back into the defined stabilized conditions*
  - *Assess whether stabilized conditions will be recovered early enough prior to landing, otherwise initiate a go-around.*

Aircraft Guidance Management

APPROACH USING LOC G/S GUIDANCE

1 Ident.: PRO-NOR-SOP-18-C-A-20806824.9001001 / 02 MAY 23
Applicable to: ALL

GENERAL

The following items are to be performed in addition to previous SOP chapters for approach flown with ILS / MLS ◁ / GLS ◁ / SLS ◁ .

2 Ident.: PRO-NOR-SOP-18-C-A-20806825.9001001 / 02 MAY 23
Applicable to: ALL

DESCENT PREPARATION

APPROACH MINIMUM...DETERMINE | PF

L2
- *For CAT II, CAT III approaches, always choose the lowest achievable minimum. The approach minimum is limited by:*
  - *Crew qualification*
  - *Airline Operating Manual requirement*
  - *Aircraft technical status*
  - *Airport status*
- *For CAT III with no DH, the flight crew should enter* NO *in the DH field of the MCDU to avoid false "HUNDRED ABOVE" or "MINIMUM" auto callouts which would not be applicable.*

L1 ARRIVAL BRIEFING...PERFORM | BOTH

L2 *For CAT II, CAT III approaches, review the following items on top of the usual briefing:*
- *Task sharing and callouts*
- *Management of degraded guidance*
- *Low visibility procedures at the airport.*

3 Ident.: PRO-NOR-SOP-18-C-A-20806826.9001001 / 02 MAY 23
Applicable to: ALL

INITIAL/INTERMEDIATE APPROACH

APPR pb on FCU..PRESS | PF

L2 - *Press the APPR pb when:*

- *Cleared for the approach*
- *On the intercept trajectory for the final approach course*
- *LOC deviation is available.*

This arms the LOC and G/S modes

- *LOC and/or G/S capture modes will engage no sooner than 3 s after being armed.*

L1 *Note:* *In NAV mode, the aircraft may leave the F-PLN to capture the LOC.*

L3 *ICAO defines the envelope where the quality of the G/S signal ensures a normal capture. This envelope is within 10 NM, ±8 ° of the centerline of the ILS glide path and up to 1.75 θ and down to 0.3 θ (θ = nominal glide path angle). When arming the approach well outside of the normal G/S capture envelope, a spurious G/S* engagement may occur due to a wrong G/S deviation signal. Whenever the flight crew notices the pitch movement, or the spurious G/S*, or the trajectory deviation, the flight crew will immediately disconnect the AP, if engaged, to re-establish a normal attitude and will disengage APPR mode. It is then recommended to arm/rearm APPR (ILS) mode within the normal capture zone.*

L1 BOTH APs..ENGAGE | PF

L2 - *When APPR mode is selected, AP1 and AP2 should be engaged*
- *Above 5 000 ft AGL, the FMA displays CAT 1 or APPR1 for approach with SLS*
- *Below 5 000 ft AGL, the FMA displays the correct approach capability for the intended approach.*

L1 LOC..CHECK ARMED | PF
G/S..CHECK ARMED | PF
LOC CAPTURE..MONITOR | PF
G/S CAPTURE..MONITOR | PF
GO-AROUND ALTITUDE..SET | BOTH

4 Ident.: PRO-NOR-SOP-18-C-A-20806827.9001001 / 02 MAY 23
Applicable to: ALL

GLIDE INTERCEPTION FROM ABOVE

The following procedure must only be applied when established on the localizer. The flight crew must react without delay to meet the stabilization criteria.

In order to get the best rate of descent when cleared by ATC and below the limiting speeds, the flight crew should lower the landing gear and select flaps as required (at least CONF 2 should be selected to ensure that the aircraft speed will not increase).

- **If above the glideslope:**

APPR MODE .... ARM / CHECK ARMED | PF
LOC..CHECK ENGAGED | PF
FCU ALTITUDE.. SET ABOVE A/C ALTITUDE | PF
V/S MODE..SELECT | PF

L2
- *Select V/S 1 500 ft/min initially. V/S in excess of 2 000 ft/min will result in the speed increasing towards VFE*
- *When reaching VFE, the AP maintains VFE and reduces the V/S without mode reversion.*

MANAGEMENT OF DEGRADED GUIDANCE

EARLY/UNTIMELY FLARE MODE ENGAGEMENT

- Perform a go-around (thrust levers set to TOGA), or
- Disconnect AP, set both FDs to OFF and continue the approach using raw data or external visual references.

In association to an early/untimely FLARE mode engagement on the FMA, the following effects may occur:

- On the PFD:
  - The RA height indication may be frozen at a positive or negative value,
  - Discrepancies between both PFDs may happen on the following indications:
    - RA heights,
    - FD orders,
    - FMA indications when both APs are engaged.
- Warnings and/or Callouts:
  - Untimely activation of the AUTOLAND warning light (*Refer to 00012386 **Not found***),
  - Untimely Terrain Awareness and Warning System (TAWS) alerts,
  - Untimely or absence of “RETARD" callout,
  - Untimely L/G GEAR NOT DOWN ECAM warning,
  - Absence or interruption of RA automatic callout (height announcement),
- On the SD: A pulsing cabin differential pressure advisory may appear on the CAB PRESS SD page.

  Note: This ECAM advisory has no consequence on the real cabin pressure.

FOR CAT II, CAT III OPERATIONS

● **In the case of:**

- Amber caution (single chime), or
- Landing capability degradation.

Above 1000 ft AGL :

ECAM / QRH PROCEDURE	COMPLETE	BOTH
REQUIRED EQUIPMENT	CHECK	PM

DESCENT PREPARATION

WEATHER AND LANDING INFORMATION..OBTAIN | PM

L2
- *The FMS vertical profile does not take into account the effect of low OAT. Therefore, vertical managed guidance:*
  - *Must not be used when the actual OAT is below the minimum temperature indicated on the approach chart or defined by the Operator, or*
  - *May not be used when temperature corrections are required (FINAL APP mode may not engage)*
- *For RNAV (GNSS) approach with LNAV VNAV minima, use of QNH from a remote station is prohibited.*

L1 F-PLN A page...CHECK | PF-PM

L2
- *If a TOO STEEP PATH is displayed after the FDP, do not use FINAL APP guidance for approach. Use NAV FPA, TRK FPA or FLS ◁ for approach*
- *0.1 degree of difference between the MCDU and the charted final vertical path is acceptable*
- *1 degree of difference between the MCDU and the charted final lateral track is acceptable.*

  Note: *A higher lateral track value can be acceptable if the navigation database has been validated to exclude potential coding error*

- *3 degree of difference between the MCDU and the charted final lateral track is acceptable for conventional radio NAVAID approach.*

L1 PROG page..COMPLETE | PF-PM

L2 *Insert the reference RWY threshold in the BRG/DIST field for position monitoring during approach.*

L1 GO-AROUND STRATEGY...REVIEW | PF

L2 *The briefing should include a review of the "Management of Degraded Navigation" chapter.*

11 Ident.: PRO-NOR-SOP-18-C-C-20806834.9001001 / 02 MAY 23
Applicable to: ALL

DESCENT

AT FL 100/10 000 ft (10.000 FT AFE for airports with elevation at 4.000 FT or above):

NAV ACCURACY..CHECK | PF

L2 *If NAV accuracy is LOW, use TRK FPA mode for approach (Refer to APPR using FPA guidance).*

L1 ● **For RNAV(GNSS) approach:**

GPS PRIMARY..CHECK | PF

L2 *GPS PRIMARY must be available on at least one FMS.*

L1 BARO REF..SET | PF

L2 *The vertical guidance requires a precise BARO setting. The maximum acceptable discrepancy between altimeters is 100 ft.*

MANAGEMENT OF DEGRADED NAVIGATION

- **For VOR and NDB approaches, be prepared to continue the approach with reference to appropriate raw data by reverting to:**
  - NAV-FPA, if the vertical guidance is not satisfactory
  - TRK-FPA, if the lateral guidance is not satisfactory.

- **For RNAV(GNSS) approaches with LNAV minima:**
  - Use the appropriate remaining AP/FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one ND.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE
    - NAV ACCUR DOWNGRAD on both NDs.
  - Be prepared to continue the approach by reverting to NAV-FPA, if the vertical guidance is not satisfactory.
- **For RNAV(GNSS) approaches with LNAV/VNAV minima:**
  - Use the appropriate remaining AP/FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one ND.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE
    - NAV ACCUR DOWNGRAD on both NDs.
  - Discontinue the approach in the case of deviation of 75 ft below the vertical path (V/DEV > ¾ dot).

APPROACH USING FINAL APP GUIDANCE FOR RNAV(RNP)

Ident.: PRO-NOR-SOP-18-C-D-00014663.0002001 / 29 MAY 13
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

GENERAL

The following items are to be performed in addition to previous SOP chapters in case of RNAV(RNP) approaches.
The procedures of the paragraph below are generic guidelines for RNAV(RNP) approaches. These procedures may be tailored by the airline for specific airfields according to their OPS approval.

Ident.: PRO-NOR-SOP-18-C-D-00014664.0002001 / 29 MAY 13
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

AIRCRAFT EQUIPMENT

Refer to PRO-SPO-51 RNP AR OPERATIONS

Ident.: PRO-NOR-SOP-18-C-D-00014677.0002001 / 29 MAY 13
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

FLIGHT PREPARATION

Use a prediction tool to check the GPS PRIMARY availability for the estimated time of operation. It ensures that the RNP criteria will be met during approach. This prediction should take into account the terrain environment.

Ident.: PRO-NOR-SOP-18-C-D-00014666.0002001 / 02 MAY 23
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

21 DESCENT PREPARATION

WEATHER AND LANDING INFORMATION...OBTAIN | PM

L2
- *The FMS vertical profile does not take into account the effect of low OAT. Therefore, vertical managed guidance:*
  - *Must not be used when the actual OAT is below the minimum temperature indicated on the approach chart or defined by the Operator, or*
  - *May not be used when temperature corrections are required (FINAL APP mode may not engage).*
- *Verify that wind is within limits*
- *Use of QNH from a remote station is prohibited.*

L1 F-PLN A page..CHECK | PF-PM

L2 *If a TOO STEEP PATH is displayed after the FDP, FINAL APP guidance cannot be used. Select another approach.*

L1 PROG page..COMPLETE | PF-PM

L2
- *Insert the reference waypoint or RWY threshold in the BRG/DIST field for position monitoring during approach*
- *Check/Insert the RNP value in the 6L field.*

L1 GO-AROUND STRATEGY..REVIEW | PF

L2 *The briefing should include a review of the "Management of Degraded Navigation" chapter.*

Ident.: PRO-NOR-SOP-18-C-D-00014667.0002001 / 02 MAY 23
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

22 DESCENT

NAVAIDS..DESELECT | PF
GPS PRIMARY ON BOTH FMS..CHECK | PF

L2 *For RNAV(RNP) approaches, GPS PRIMARY must be available on both FMS (GPS PRIMARY LOST is not displayed on NDs).*

L1 GPS 1+2..CHECK both in NAV | PF

L2
- *Both GPS must be in NAV on the GPS MONITOR Page*
- *Both GPS and both FMS must be available before the IAF. Thus, if one FMS is inoperative or if one GPS is not in NAV before the IAF, RNAV(RNP) is not allowed.*

L1 TERR on ND..ON | PF

L2 *Unless weather radar is required on one side, the flight crew selects terrain on both NDs.*

Ident.: PRO-NOR-SOP-18-C-D-00014668.0002001 / 02 MAY 23
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

23 INITIAL / INTERMEDIATE / FINAL APPROACH

BARO REF/ALTIMETER..CHECK | PF

L2 *The vertical guidance requires a precise BARO setting. The maximum acceptable discrepancy between altimeters is 100 ft.*

L1 FD or AP/FD..USE FOR APPROACH | PF

L2
- *The use of FD or AP/FD provides the required navigation accuracy. Refer to Use of NAV and FINAL APP Modes for Approach*
- *For operations with RNP below 0.3 NM, one AP must be engaged.*

L1 L/DEV...CHECK DISPLAYED | PF

L2 *Check that the L/DEV scale is displayed on the PFD.*

L1 APPR pb on FCU...PRESS | PF

L2 *Press the APPR pb when all of the following conditions are satisfied:*
- *The aircraft is cleared for approach*
- *TO waypoint is the final descent point.*

L1 APP NAV...CHECK ARMED or ENGAGED | PF
FINAL...CHECK ARMED | PF

L2
- *Check that the V/DEV scale is displayed on the PFD*
- *At the VIP, a blue arrow on ND indicates that FINAL APP engagement conditions are met.*

L1

At the Final Descent Point :

FINAL APP...CHECK ENGAGED | PF
GO-AROUND ALTITUDE...SET | BOTH
FLIGHT PARAMETERS...MONITOR | PM

L2
- *Monitor L/DEV and V/DEV on PFD*
- *Monitor XTK on ND*
- *Crosscheck distances versus altitudes as published on the charts*
- *The PM calls out if excessive deviation occurs:*
  - *L/DEV reaches ½ dot*
  - *V/DEV reaches ½ dot.*
    On the vertical scale, one dot corresponds to 100 ft. Therefore, ½ dot is 50 ft.

  Refer to PRO-NOR-SOP 90 Flight Parameters in Approach
- *Go-around must be initiated if excessive deviation occurs:*
  - *L/DEV reaches 1 RNP*
  - *V/DEV reaches ¾ dot below the vertical profile.*
    On the vertical scale, one dot corresponds to 100 ft. Therefore, ¾ dot is 75 ft.

ENGINE FAILURE

If one engine fails in approach with NAV or FINAL APP mode:
- if RNP < 0.3 NM, the flight crew must perform a Go-Around
- if RNP = 0.3 NM, the flight crew must disconnect the AP and may continue the approach with FDs engaged.

Ident.: PRO-NOR-SOP-18-C-D-00014671.0002001 / 25 JAN 17
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11139

MANAGEMENT OF DEGRADED NAVIGATION

The approach may be continued in case of single failure of:
- GPS (MMR)
- FMGS
- EFIS DU
- MCDU
- AP

Discontinue the approach in the following cases:
- FINAL APP does not engage
- GPS PRIMARY LOST on both NDs
- Dual NAV ACCUR DOWNGRAD
- FM/GPS POSITION DISAGREE
- FMS1/FMS2 POS DIFF
- Dual loss of FMGC or dual loss of FINAL APP mode
- Dual AP failure if the RNP < 0.3 NM
- Loss of GPWS TERRAIN function in case of inconsistencies affecting obstacles or terrain computation
- NAV ALT DISCREPANCY

APPROACH USING FPA GUIDANCE

28 Ident.: PRO-NOR-SOP-18-C-E-20806850.9001001 / 02 MAY 23
Applicable to: ALL

GENERAL

The following items are to be performed in addition to previous SOP chapters in the following cases:
- RNAV(GNSS) approaches with LNAV minima using mixed NAV FPA guidance
- RNAV(GNSS) approaches with LP minima using LOC FPA guidance
- Conventional approaches based on VOR and NDB using selected TRK FPA or mixed NAV FPA guidance
- ILS G/S OUT, LOC ONLY and LOC B/C approaches.

The approach is flown in TRK FPA when:
- The approach is not stored in the database or
- NAV accuracy is LOW.

MANAGEMENT OF DEGRADED NAVIGATION

- **For VOR and NDB approaches in NAV-FPA, if lateral guidance is not satisfactory:**
  - Be prepared to continue the approach with reference to appropriate raw data by reverting to TRK-FPA.
- **For RNAV(GNSS) approaches, with LNAV minima:**
  - Use the appropriate remaining AP/FD in the following cases:
    - GPS PRIMARY LOST on one ND
    - NAV ACCUR DOWNGRAD on one ND.
  - Discontinue the approach in the following cases, if external visual references are not sufficient to proceed visually:
    - GPS PRIMARY LOST on both NDs
    - XTK > 0.3 NM
    - NAV FM/GPS POS DISAGREE
    - NAV ACCUR DOWNGRAD on both NDs.

CIRCLING APPROACH

Applicable to: ALL

39 Ident.: PRO-NOR-SOP-18-C-F-20806859.9001001 / 02 MAY 23

Circling Approach is not authorized by Airline Policy, except for those airports specified in the Operations Manual.

GENERAL

The circling approach is the visual phase of an instrument approach to bring an aircraft into position for landing on a runway which is not suitably located for a straight-in approach.

CAUTION	The flight crew must conduct the flight within the circling area, while maintaining required visual references at all times.

40 Ident.: PRO-NOR-SOP-18-C-F-20806860.9001001 / 02 MAY 23

APPROACH PREPARATION

For a circling approach, the approach preparation should include the following additional items in the FMS programming.

F-PLN

Introduce the instrument approach procedure, including the missed approach procedure for instrument approach.

SEC F-PLN

The landing runway must be inserted into the SEC F-PLN.

Update the SEC F-PLN as follows:
- Copy the active F-PLN
- Revise the landing runway.

41 Ident.: PRO-NOR-SOP-18-C-F-20806861.9001001 / 02 MAY 23

INSTRUMENT APPROACH

The flight crew flies a stabilized approach at "F" speed, configuration 3 and landing gear down.

42 Ident.: PRO-NOR-SOP-18-C-F-20806862.9001001 / 02 MAY 23

CIRCLING APPROACH

- **At the Circling MDA(H) at the latest:**

  Perform a level off

- **At MAP, if the flight crew finds no visual reference:**

  Initiate a go around

- **When required conditions for circling are satisfied:**

  Select TRK FPA

  Proceed to downwind leg

  At any time in the downwind leg, activate the SEC F-PLN

  Disconnect the AP and remove the FDs at the latest before starting the descent toward the runway

  Set the landing configuration when appropriate, but ensure early stabilization in final.

If, at any time during the circling procedure, the required visual references are lost, initiate a go around following the missed approach of the initial instrument approach (unless otherwise specified).

43 Ident.: PRO-NOR-SOP-18-C-F-20806863.9001001 / 02 MAY 23

RNAV VISUAL APPROACH

Applicable to: ALL

44 Ident.: PRO-NOR-SOP-18-C-G-20806864.9001001 / 02 MAY 23

GENERAL

The aircraft navigates using the RNAV system, but the position is monitored by visual reference to the ground, obstacles and other traffic.

RNAV visual approach must be stored and retrievable from the Navigation Database.

45 Ident.: PRO-NOR-SOP-18-C-G-20806865.9001001 / 02 MAY 23

EQUIPMENT REQUIRED

- 1 FMS
- 1 GPS or 2 DME to update FM position
- Additional requirement if indicated on the approach chart.

46 Ident.: PRO-NOR-SOP-18-C-G-20806866.9001001 / 02 MAY 23

FMGC GUIDANCE MODE

- **If no required accuracy is published:**

  The use of FMGC guidance mode is at flight crew discretion.

- **If RNAV 1 or RNP 1 is required on the published approach chart:**

  The flight crew should use adequate FMGC guidance modes.

Note: *The use of lateral and vertical managed guidance modes reduces the crew workload and improves energy management.*

For RNAV VISUAL approach including RF legs, *Refer to FCTM/00019329 **Not found*** for RF leg flying technique.

47 Ident.: PRO-NOR-SOP-18-C-G-20806867.9001001 / 02 MAY 23

DESCENT PREPARATION

For approach data insertion in the FMS, keep the BARO/MDA field empty on the PERF APPR Page.

48 Ident.: PRO-NOR-SOP-18-C-G-20806868.9001001 / 02 MAY 23

DESCENT

For RNAV VISUAL approaches requiring GPS, check that GPS PRIMARY is available on at least 1 FMS.

49 Ident.: PRO-NOR-SOP-18-C-G-20806869.9001001 / 02 MAY 23

FINAL APPROACH

The flight crew must disconnect the AP at the latest at the Minimum Use Height of the AP.

*Refer to 00019567 **Not found***

VISUAL APPROACH

Ident.: PRO-NOR-SOP-18-C-H-00014574.0001001 / 17 OCT 22
Applicable to: MSN 04827-04860

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach to be stabilized by 1 000 ft AFE on the correct approach path, in the landing configuration, at VAPP.

Method:
- The AP is not used
- Both FDs are OFF
- FPV use is recommended
- A/THR use is recommended with managed speed.

Bear in mind the possible risk of optical illusions due to hindered night vision.

Ident.: PRO-NOR-SOP-18-C-H-00014574.0002001 / 02 MAY 23
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11139

GENERAL

Perform the approach on a nominal 3 ° glideslope using visual references. Approach to be stabilized by 1 000 ft AFE on the correct approach path, in the landing configuration, at VAPP.

Method:
- The AP is not used
- Both FDs are OFF
- FPV use is recommended
- A/THR use is recommended with managed speed.

Bear in mind the possible risk of optical illusions due to hindered night vision.

Note: *If the forecasted tailwind at landing is greater than 10 kt, decelerated approach is not allowed, and the speed should be stabilized around VREF + 5 kt in final.*

50 Ident.: PRO-NOR-SOP-18-C-H-20806871.9001001 / 02 MAY 23
Applicable to: ALL

INITIAL/INTERMEDIATE APPROACH

The flight plan selected on the MCDU should include the selection of the landing runway. The downwind leg may also be part of the flight plan. This may be a useful indication of the aircraft position in the circuit on the ND.
However, visual references must be used.
Therefore, at the beginning of the downwind leg:

Manually ACTIVATE APPR
Select FDs to OFF
Select TRK FPA to have FPV displayed
Check A/THR active.

Turn into base leg with a maximum of 30 ° of bank. Descent with approximate FPA, in FLAPS 2, at F speed.
Extend the downwind leg to 2.5 NM from the selected runway threshold. Additionally, adjust the flight path to maintain the aircraft 2.5 NM aside the runway.

Note: *For best practices regarding visual approach, it is recommended to use ROSE NAV selected on the ND with the range adjusted to 10 NM.*

Pilots may create a NEW WPT based on Place/Bearing/Distance in order to get a reference to enter Base to Land. This WPT created can be showed in FIX INFO:

REFERENCE	***NEW WPT TO GET A REFERENCE TO ENTER BASE TO LAND***
PLACE	*RWYXXX*
BEARING	*RWY TRACK +(-) 135° (45° according to base turn side)*
DISTANCE	*3.5 NM*

51 Ident.: PRO-NOR-SOP-18-C-H-20806872.9001001 / 02 MAY 23
Applicable to: ALL

FINAL APPROACH

The speed trend arrow and FPV help the flight crew make timely and correct thrust settings (if in manual thrust), and approach path corrections.

Avoid descending through the correct approach path with idle thrust. (Late recognition of this situation without a prompt thrust increase may lead to considerable speed decay and altitude loss).
Ensure that the aircraft is stabilized on the final descent path at VAPP (or ground speed mini) in the landing configuration with the thrust stabilized (usually above idle) at 1 000 ft above airfield elevation AFE.
If the aircraft is not stabilized, the flight crew must initiate a go around, unless they think that only small corrections are necessary to rectify minor deviations from stabilized conditions due, amongst others, to external perturbations.

Avoid any tendency to “duck under” in the late stages of the approach.
Avoid destabilizing the approach in the last 100 ft, in order to have the best chance of performing a good touchdown at the desired position.

  DEROTATION... INITIATE | PF

ALL THRUST LEVERS.................................. REV MAX or REV IDLE | PF

L2 *The flight crew must select reverse thrust immediately after landing gear touchdown.*

L12

Note: For REV thrust configuration Refer to PRO-NOR-SOP-16 Descent Preparation - Preferential Setting for Landing. In addition, The flight crew must immediately select REV MAX, if any of the following occurs at any time during the landing:

- *An emergency*
- *The deceleration is not as expected*
- *A failure affects the landing performance*
- *A long flare or a long touchdown*
- *An unexpected tailwind.*

L1 *Due to any operational condition, REV MAX thrust may be used.*

L2 *A small pitch up may occur during thrust reversers deployment before nose landing gear touchdown. However, the flight crew can easily control this pitch up.*
As soon as the flight crew selects reverse thrust, they must perform a full-stop landing.

L1 GND SPLRS...CHECK/ANNOUNCE | PM

L2 *Check that the WHEEL SD page displays the ground spoilers extended after touchdown.*

If no ground spoilers are extended:
- *Check that all thrust levers are set to IDLE detent.*
- *Set both thrust reverser levers to MAX REV, and fully press the brake pedals.*

L1 *Note: If ground spoilers are not armed, ground spoilers extend at reverser thrust selection.*

REVERSERS...CHECK/ANNOUNCE | PM

L2
- *Check that the ECAM E/WD displays the expected reverser deployment (i.e. REV).*
- *If reverser(s) do not deploy as expected, one of the main deceleration means is lost. The flight crew should consider adapting the available deceleration means to stop the aircraft.*

L1 DIRECTIONAL CONTROL...MONITOR/ENSURE | PF

L2
- *Ensure directional control. Use the rudder pedals for directional control.*
- *During rollout, avoid sidestick inputs (either lateral or longitudinal)*
- *If the flight crew encounters directional control problems, they should reduce the thrust to REV IDLE until directional control is satisfactory.*

L1 *Do not use the nosewheel steering control handle before reaching taxi speed.*

● **If autobrake is selected:**

AUTO BRK...CHECK/ANNOUNCE | PM

L2 *Check and announce BRK LO or BRK MED on the FMA.*

L1 *Note: If no ground spoilers are extended, the autobrake will not activate.*

WARNING	*Never change the A/BRK selection during roll out.*

AUTOBRAKE....................MONITOR | PM

L2 *During all the rollout, the PM monitors that the FMA displays BRK LO or BRK MED, and calls out if the autobrake mode disengages.*

L1
- **If landing without autobrake:**

  BRAKES....................AS RQRD | PF

L2
- *Although the green hydraulic system supplies the braking system, if pedals are pressed rapidly, a brake pressure indication appears briefly on the BRAKE PRESS indicator.*
- *Braking may begin before the nosewheel has touched down, if required for performance reasons. However, when comfort is the priority, the flight crew should delay braking until the nosewheel has touched down.*

L1 DECELERATION....................CHECK/ANNOUNCE | PM

L2 *The flight crew feels the deceleration. The flight crew checks the speed trend on the PFD to confirm the deceleration.*

- *The deceleration is not as expected*
- *A failure affects the landing performance*

- *A long flare or a long touchdown*
- *An unexpected tailwind.*

A small pitch up may occur during thrust reversers deployment before nose landing gear touchdown. However, the auto-flight system will control this pitch up.
As soon as the flight crew selects reverse thrust, they must perform a full-stop landing.

L1 GND SPLRS..........CHECK/ANNOUNCE | PM

L2 *Check that the WHEEL SD page displays the ground spoilers extended after touchdown.*

If no ground spoilers are extended:
- *Check that all thrust levers are set to IDLE detent*
- *Set both thrust reverser levers to MAX REV, and fully press the brake pedals.*

L1 *Note: If ground spoilers are not armed, ground spoilers extend at reverser thrust selection.*

REVERSERS..........CHECK/ANNOUNCE | PM

L2
- *Check that the ECAM E/WD displays the expected reverser deployment (i.e. REV)*
- *If reverser(s) do not deploy as expected, one of the main deceleration means is lost. The flight crew should consider adapting the available deceleration means to stop the aircraft.*

L1 DIRECTIONAL CONTROL..........MONITOR/ENSURE | PF

L2
- *Monitor directional control, if the rollout is automatic*
- *Ensure directional control, if rollout is manual. Use rudder pedals for directional control.*
- *During rollout, avoid sidestick inputs (either lateral or longitudinal)*
- *If the flight crew encounters directional control problems, they should reduce the thrust to REV IDLE until directional control is satisfactory.*

L1 *Do not use the nosewheel steering control handle before reaching taxi speed.*

● **If autobrake is selected:**

AUTOBRAKE..........MONITOR | PM

L2 *During all the rollout, the PM monitors the blue light on the autobrake panel, and calls out if the autobrake mode disengages.*

L1 *Note: If no ground spoilers are extended, the autobrake will not activate.*

● **If landing without autobrake:**

BRAKES..........AS RQRD | PF

L2
- *Although the green hydraulic system supplies the braking system, if pedals are pressed rapidly, a brake pressure indication appears briefly on the BRAKE PRESS indicator*
- *Braking may begin before the nosewheel has touched down, if required for performance reasons. However, when comfort is the priority, the flight crew should delay braking until the nosewheel has touched down.*

L1 DECELERATION.......................................CHECK/ANNOUNCE | PM

L2 *The flight crew feels the deceleration. The flight crew checks the speed trend on the PFD to confirm the deceleration.*

AT 70 KT

SEVENTY KNOTS.......................................ANNOUNCE | PM
BOTH THRUST LEVERS.......................................REV IDLE | PF

L2 *It is better to reduce thrust when passing 70 kt. However, high levels of reverse thrust may be used in order to control aircraft speed in the case of an emergency.*

L1 **CAUTION** *Avoid the use of high levels of reverse thrust at low airspeed, unless required due to an emergency. The distortion of the airflow, caused by gases reentering the compressor, can cause engine stalls that may result in excessive EGT.*

16 Ident.: PRO-NOR-SOP-19-B-20806888.9001001 / 02 MAY 23
Applicable to: ALL

BEFORE 20 KT

AUTO BRK.......................................DISARM | PF

L2 *Disarm autobrake before 20 kt to avoid some brake jerks at low speed.*
The flight crew should use brake pedals to disarm the autobrake.

17 Ident.: PRO-NOR-SOP-19-B-20806889.9001001 / 02 MAY 23
Applicable to: ALL

END OF ROLL OUT

REVERSERS.......................................STOW | PF

L2
- *When the aircraft reaches the taxi speed, and before it leaves the runway, stow the reversers.*
- *On snow-covered grounds, the reversers should be stowed when the aircraft speed reaches 25 kt.*
- *When deselecting the reversers, be careful not to apply forward thrust by moving the thrust levers beyond the FWD IDLE position.*

L1 **CAUTION** *Except in an emergency, do not use the reverse thrust to control the aircraft speed while on taxiways.*

L2 *On taxiways, the use of reversers, even restricted to idle thrust, would have the following effects:*

- *The engines may ingest fine sand and debris that may be detrimental to the engines and airframe systems.*
- *On snow–covered areas, snow will recirculate into the air inlet, and may cause an engine flameout or rollback.*

L1 AP.. OFF | PF

L2 *Disengage the APs at the end of the roll out (before leaving the runway at the latest).*

14 ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI ICE..AS RQRD | PM

L2
- *If engine anti-ice is used, carefully control taxi speed, particularly on wet or slippery surfaces because ground idle is increased*
- *During ground operation, when in icing conditions and when the OAT is at +3 °C or below for more than 30 min, the following procedure should be applied for ice shedding:*

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to approximately 70 % of N1 for 30 s at intervals not more than 30 min.
If ground surface or environment do not permit to accelerate the engine to 70 % N1, then power setting and dwell time should be as high as practical.
When operating in conditions of freezing rain, freezing drizzle, freezing fog or heavy snow, ice shedding may be enhanced, by additional run ups at intervals, to not exceed 10 min, advancing throttles to 70 % N1 momentarily (no hold time).

Ident.: PRO-NOR-SOP-21-A-00011849.0002001 / 02 MAY 23

15 ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI ICE...AS RQRD | PM

L2
- *If engine anti-ice is used, carefully control taxi speed, particularly on wet or slippery surfaces because ground idle is increased*
- *During ground operation, when in icing conditions and the OAT is plus 3 °C or less, the following procedure should be applied for ice shedding:*

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should accelerate the engines to minimum 50 % of N1 at intervals not more than 15 min. There is no requirement to maintain the high thrust settings.

Ident.: PRO-NOR-SOP-21-A-00011849.0003001 / 02 MAY 23
Applicable to: MSN 08495-09324, 10949-11139

16 ANTI ICE

CAUTION	In icing conditions (*Refer to LIM-ICE_RAIN Definition of Icing Conditions*), the flight crew must turn on the engine anti-ice and should not wait until seeing ice building up.

ENG ANTI ICE...AS RQRD | PM

L2
- *If engine anti-ice is used, carefully control taxi speed, particularly on wet or slippery surfaces because ground idle is increased*
- *During ground operation, when in icing conditions and when the OAT is at +3 °C or below, or if significant engine vibrations occur, the following procedure should be applied for ice shedding:*

CAUTION	*If, during thrust increase, the aircraft starts to move, immediately retard the thrust levers to IDLE.*

If ground surface conditions and the environment permit, the flight crew should set parking brake to ON or brake with pedals and accelerate the engines to minimum 60 % of N1 . Engine accelerations should be performed at intervals not more than:

- *30 min if OAT is at +3 °C or below but above -9 °C*
- *120 min if OAT is at -9 °C or below.*

There is no requirement to maintain the high thrust settings.

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098

22

The Single Engine Taxi Without APU (SETWA) must be considered as the standard operating procedure when taxiing in the aircraft. This procedure must not be performed if any of the following situations apply:

- Overweight landing / Heavy gross weight
- Slippery taxiways
- Uphill slopes
- Low visibility conditions
- The Captain considers that the workload will increase too much after landing / during taxi
- If the Aircraft is not configured with Single Engine Taxi Without APU (SETWA), One Engine Taxi with APU may be considered with the above conditions.

● **If none of the conditions listed above apply, no less than 3 min after high thrust operations:**

ENGINE MINIMUM COOLING TIME....................CONSIDER | PM

Refer to PRO-NOR-SOP-22 Parking - ENG MASTER Levers

Note: *When REV IDLE thrust setting is used for landing, engine cooling down is not necessary and the engine may be shut down right away.*

● **When the APU indicates AVAIL (if SETWA is not installed) and taxiing in a straight line:**

Note: *During engine shutdown, a slight jerk forward may occur, if brakes are applied while the aircraft is moving.*

ENG 2.. OFF | PM

Note: *When REV IDLE thrust setting is used for landing, engine cooling down is not necessary and the engine may be shut down right away.*
Refer to PRO-NOR-SOP-22 Parking - ENG MASTER Levers

Y ELEC PUMP.. ON | PM

This avoids running the PTU.

Note: *If necessary, the Captain may turn the engine on again in order to continue taxi to the gate.*

CAUTION	The flight crew must exercise caution when taxiing on one engine to avoid generating excessive jet blast.

CAUTION	The engine may not be shut down when a turn is being performed.

Ident.: PRO-NOR-SOP-21-A-20800446.9001002 / 02 MAY 23
Applicable to: MSN 08495-09324, 10949-11139

23

One Engine Taxi is the normal taxi in procedure. It must be disconsidered if any of following situations apply:
- Overweight landing / High gross weight
- Slippery taxiways
- Uphill slopes
- Low visibility conditions
- APU not working
- The Captain considers that the workload will increase too much after landing / during taxi

● **After high thrust operations:**
ENGINE MINIMUM COOLING TIME...CONSIDER | PM

Refer to PRO-NOR-SOP-22 Parking - ENG MASTER Levers

Note: *When REV IDLE thrust setting is used for landing, engine cooling down is not necessary and the engine may be shut down right away.*

● **If none of the conditions listed above apply, no less than 3 min after high thrust operations:**

Note: *During engine shutdown, a slight jerk forward may occur, if brakes are applied while the aircraft is moving.*

ENG 2.. OFF | PM

Note: *When REV IDLE thrust setting is used for landing, engine cooling down is not necessary and the engine may be shut down right away.*
Refer to PRO-NOR-SOP-22 Parking - ENG MASTER Levers

Y ELEC PUMP... ON | PM

This avoids running the PTU.

Note: *On ground, if the ECAM caution ENG 1(2) SHAFT PROT FAULT triggers and all amber crosses are displayed on the engine 2 parameters (upper ECAM display), the flight crew can consider this caution as spurious and can disregard it.*

Note: *If necessary, the Captain may turn the engine on again in order to continue taxi to the gate.*

CAUTION	The flight crew must exercise caution when taxiing on one engine to avoid generating excessive jet blast.

CAUTION	The engine may not be shut down when a turn is being performed.

GENERAL

The flight crew should apply the following procedure as per company policy, when the last passenger left the aircraft and the securing of the aircraft is intended.
Airbus recommends performing the following procedure when the aircraft is left unattended: i.e. no qualified flight crew or ground crew are in the cockpit to supervise and monitor the aircraft systems.

Prior to performing this check, the following SUP Adverse Weather procedures should be taken into account when appropriate:
- Securing the aircraft for cold soak (*Refer to 00020772 **Not found***).
- Water system draining (*Refer to 00002313 **Not found***).
- Ground operations in heavy rain (*Refer to 00020720 **Not found***).
- Operations on contaminated airports (*Refer to 00020725 **Not found***).
- Operations with volcanic ash, sand or dust (*Refer to 00020745 **Not found***).

COMMUNICATIONS AND STANDARD TERMS

1 Ident.: PRO-NOR-SCO-20806946.9001001 / 02 MAY 23
Applicable to: ALL

Standard phraseology is essential to ensure effective crew communication. The phraseology should be concise and exact. The following Chapter lists the callouts that should be used as standard. They supplement the callouts identified in the SOP.
These standard Airbus callouts are also designed to promote situational awareness, and to ensure crew understanding of systems and their use in line operation.

CHECKLIST CALLOUTS

2 Ident.: PRO-NOR-SCO-20806947.9001001 / 02 MAY 23
Applicable to: ALL

- “CHECK”: A command for the other pilot to check an item.
- “CHECKED”: A response that an item has been checked.
- “CROSSCHECKED”: A callout verifying information from both pilot stations.

If a checklist needs to be interrupted, it must be restarted from the beginning.
Upon completion of a checklist announce: “__CHECKLIST COMPLETE”.

ACTIONS COMMANDED BY PF

Applicable to: ALL

3 Ident.: PRO-NOR-SCO-A-20806948.9001001 / 02 MAY 23

GENERAL

The following commands do not necessarily initiate a guidance mode change, eg.: selected to managed/managed to selected. The intent is to ensure clear, consistent, standard communication between crewmembers.
All actions performed on the FCU and MCDU must be checked on the PFD and ND (eg.: “FL 350 blue”, “FL 200 magenta"). Ensure that the correct FCU knob is used, then verify indications on the PFD/ND.

4 Ident.: PRO-NOR-SCO-A-20806949.9001001 / 02 MAY 23

SET

The “SET” command means using an FCU knob to set a value, but not to change a mode.
SET is accomplished by only rotating the appropriate selection knob.

Example:
- ”SET GO AROUND ALTITUDE__FT”
- “SET FL __”
- “SET HDG __”

5 Ident.: PRO-NOR-SCO-A-20806950.9001001 / 02 MAY 23

MANAGE/PULL

The “MANAGE” command means pushing an FCU knob to engage, or arm, a managed mode or target.

The “PULL” command means pulling an FCU knob to engage a selected mode or target. Example:

- "PULL HDG 090”	(HDG/TRK knob is pulled and turned).
- “MANAGE NAV”	(HDG/TRK knob is pushed).
- “FL 190 PULL”	(ALT knob is turned and pulled).
- “FL 190 MANAGE”	(ALT knob is turned and pushed).
- “PULL SPEED 250 KNOTS”	(SPD/MACH knob is pulled and turned).
- “MANAGE SPEED”	(SPD/MACH knob is pushed).

Note: *If the value was previously set, there is no requirement to repeat the figure. Simply call e.g. PULL HDG: PULL SPEED: FL PULL.*

The VS/FPA knob has no managed function. The standard callouts for the use of this knob are as follows:
V/S Plus (or Minus) 700 PULL, or

FPA Minus 3 ° PULL	(V/S/FPA knob is turned and pulled)
PUSH TO LEVEL OFF	(V/S/FPA knob is pushed)

6 Ident.: PRO-NOR-SCO-A-20806951.9001001 / 02 MAY 23

ARM

The “ARM __” command means arming a system by pushing the specified FCU button.
e.g. : “ARM APPROACH”
e.g. : “ARM LOC.”

7 Ident.: PRO-NOR-SCO-A-20806952.9001001 / 02 MAY 23

ON/OFF

The simple ON or OFF command is used for the autopilot, flight directors, autothrust and the bird (flight path vector).

e.g.: BIRD ON (The HDG-V/S / TRK-FPA pb is pushed.)

FMA

8 Ident.: PRO-NOR-SCO-20806953.9001001 / 02 MAY 23
Applicable to: ALL

The PF should call out any FMA change, unless specified differently (e.g. CAT II & III task sharing). Therefore, the PF should announce:
- All armed modes with the associated color (e.g. blue, magenta): "G/S blue", "LOC blue".
- All active modes without the associated color (e.g. green, white): "NAV", "ALT".

The PM should check and respond, "CHECKED" to all FMA changes called out by the PF.

ALTITUDE

9 Ident.: PRO-NOR-SCO-20806954.9001001 / 02 MAY 23
Applicable to: ALL

The PM calls out "THOUSAND FEET TO LEVEL OFF" when passing 1 000 ft before the cleared altitude or FL, and the PF calls out "checked".

FLAPS OR GEAR CALLOUTS

Applicable to: ALL

10 Ident.: PRO-NOR-SCO-B-20806955.9001001 / 02 MAY 23

FLAPS' CALLOUTS

FLAPS' CONFIGURATION	CALLOUT
1	"FLAPS ONE"
1 + F	"FLAPS ONE"
0	"FLAPS ZERO"

The reply will be given when selecting the new flap position.
e.g.:

	CALLOUT	REMARK
PF	"FLAPS ONE"	
PM	"SPEED CHECKED"	PM checks the speed: - Above the S or F speed and accelerating (Takeoff) - Below VFE next and decelerating (Approach)
	"FLAPS ONE"	PM selects the FLAPS lever position and replies after checking the blue number on the ECAM flaps indicator to confirm the correct selection has been made.

11 Ident.: PRO-NOR-SCO-B-20806956.9001001 / 02 MAY 23

GEAR CALLOUTS

	CALLOUT	REMARKS
PF	"GEAR UP (DOWN)"	
PM	"GEAR UP (DOWN)"	The PM selects the L/G lever position and replies after checking the red lights on the LDG GEAR indicator to confirm gear operation.

FLIGHT PARAMETERS

Ident.: PRO-NOR-SCO-C-00011912.0001001 / 22 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734, 02896-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 04441-04544, 04827-04974, 05066, 05101-05222

APPROACH

During approach, the PM announces:

- "SPEED" if the speed decreases below the speed target -5 kt or increases above the speed target +10 kt.
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than -2.5 ° or higher than +10 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS.
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "V/DEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 ° (VOR) or 5 ° (ADF).
- "__ FT HIGH (LOW)" at altitude checks points.

Note: *The PM announces the attitude deviations until landing.*

Ident.: PRO-NOR-SCO-C-00011912.0002001 / 22 MAR 17
Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662

APPROACH

During approach, the PM announces:
- "SPEED" if the speed decreases below the speed target -5 kt or increases above the speed target +10 kt
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than -2.5 ° or higher than +7.5 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS.
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "V/DEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 ° (VOR) or 5 ° (ADF)
- "__ FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

Ident.: PRO-NOR-SCO-C-00011912.0003001 / 28 MAY 20
Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11139

APPROACH

During approach, the PM announces:
- "SPEED" if the speed decreases below the speed target -5 kt or increases above the speed target +10 kt
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than -2.5 ° or higher than +10 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS.
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "V/DEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 ° (VOR) or 5 ° (ADF)
- "__ FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

RNAV (RNP) APPROACH

- "LAT-DEV" when L/DEV reaches ½ dot
- "VDEV" when ½ dot deviation above or below path
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when the bank angle goes above 30 °.

Ident.: PRO-NOR-SCO-C-00011912.0005001 / 28 MAY 20
Applicable to: MSN 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

APPROACH

During approach, the PM announces:

- "SPEED" if the speed decreases below the speed target -5 kt or increases above the speed target +10 kt
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when bank angle becomes greater than 7 °
- "PITCH" when pitch attitude becomes lower than -2.5 ° or higher than +7.5 °
- "LOC" or "GLIDE" when either localizer or glide slope deviation is:
  - ½ dot LOC
  - ½ dot GS.
- "CROSS TRACK" when the XTK is greater than 0.1 NM
- "V/DEV" when the vertical deviation is greater than ½ dot
- "COURSE" when greater than ½ dot or 2.5 ° (VOR) or 5 ° (ADF)
- "__ FT HIGH (LOW)" at altitude checks points.

Note: The PM announces the attitude deviations until landing.

RNAV (RNP) APPROACH

- "LAT-DEV" when L/DEV reaches ½ dot
- "VDEV" when ½ dot deviation above or below path
- "SINK RATE" when the descent rate exceeds 1 000 ft/min
- "BANK" when the bank angle goes above 30 °.

LANDING

During landing, the PM announces:

- "PITCH PITCH", if the pitch attitude approaches the tail strike pitch limit indicator ◁ , or reaches 7.5 °
- "BANK BANK", if the bank angle reaches 7 °.

Ident.: PRO-NOR-SCO-C-00021570.0001001 / 22 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11139

LANDING

During landing, the PM announces:

- "PITCH PITCH", if the pitch attitude approaches the tail strike pitch limit indicator ◁ , or reaches 10 °
- "BANK BANK", if the bank angle reaches 7 °.

12 Ident.: PRO-NOR-SCO-C-20806959.9001001 / 02 MAY 23
Applicable to: ALL

GO-AROUND

During a go-around, the PM announces:

- "BANK", if the bank angle becomes greater than 7 °
- "PITCH", if the pitch attitude becomes greater than 20 ° up or less than 10 ° up
- "SINK RATE", if there is no climb rate.

PF/PM DUTIES TRANSFER

13 Ident.: PRO-NOR-SCO-20806960.9001001 / 02 MAY 23
Applicable to: ALL

To transfer control, flight crewmembers must use the following callouts:

- To give control: The pilot calls out "YOU HAVE CONTROL". The other pilot accepts this transfer by calling out "I HAVE CONTROL", before assuming PF duties.
- To take control: The pilot calls out "I HAVE CONTROL". The other pilot accepts this transfer by calling out "YOU HAVE CONTROL", before assuming PM duties.

PILOT/CABIN CREW ANNOUNCEMENTS

14 Ident.: PRO-NOR-SCO-20806961.9001001 / 02 MAY 23
Applicable to: ALL

Crewmembers must use the following announcements:

ACTION	SPANISH	PORTUGUESE
To inform the beginning of refueling	"TRIPULACIÓN, INICIO ABASTECIMIENTO DE COMBUSTIBLE."	"TRIPULAÇÃO, ESTAMOS INICIANDO O ABASTECIMENTO DE COMBUSTÍVEL."
To inform the end of refueling	"TRIPULACIÓN, ABASTECIMIENTO DE COMBUSTIBLE TERMINADO."	"TRIPULAÇÃO, ABASTECIMENTO DE COMBUSTÍVEL FINALIZADO."
To request Slides Arming	"TRIPULACIÓN, PUERTAS EN AUTOMÁTICO, CROSSCHECK Y REPORTAR."	"TRIPULAÇÃO, PORTAS EM AUTOMÁTICO, CROSSCHECK E CONFIRMAR."
To inform takeoff clearance	"TRIPULACIÓN, PRÓXIMOS AL DESPEGUE."	"TRIPULAÇÃO, ESTAMOS PRÓXIMO A DECOLAGEM."
To inform the end of the sterile cockpit during climb / To inform the beginning of the sterile cockpit during descent	"TRIPULACIÓN, 10.000 PIES."	"TRIPULAÇÃO, 10.000 PÉS."
To request cabin to be prepared for landing	"TRIPULACIÓN, ASEGURAR CABINA PARA ATERRIZAR."	"TRIPULAÇÃO, PREPARAR PARA O POUSO."
To advise cabin that the landing is imminent	"TRIPULACIÓN, PRÓXIMOS AL ATERRIZAJE."	"TRIPULAÇÃO, ESTAMOS PRÓXIMO AO POUSO."
To request Slides Disarming	"TRIPULACIÓN, PUERTAS EN MANUAL, CROSSCHECK Y REPORTAR."	"TRIPULAÇÃO, PORTAS EM MANUAL, CROSSCHECK E CONFIRMAR."
To request Emergency Evacuation (The announcement can be followed by the chosen side of the aircraft to be evacuated)	"TRIPULACIÓN, EVACUACIÓN."	"TRIPULAÇÃO, EVACUAÇÃO."
To inform Emergency Descent.	"TRIPULACION, DESCENSO DE "EMERGENCIA, DESCENSO DE EMERGENCIA."	"TRIPULAÇÃO, DESCIDA DE EMERGÊNCIA, DESCIDA DE EMERGÊNCIA."
To inform safe altitude is reached, when the altitude is 14 000 ft MSL or below.	"TRIPULACION, ALTITUD SEGURA."	"TRIPULAÇÃO, ALTITUDE SEGURA."

AIRFRAME DEICING/ANTI-ICING PROCEDURE ON GROUND

Ident.: PRO-NOR-SUP-ADVWXR-A-00020694.0001001 / 17 MAY 21
Applicable to: MSN 01251, 02014, 06561, 10949-11139

BEFORE FLUID SPRAYING

In all situations, it is the captain's responsibility to decide if the ground crew must deice/anti-ice the aircraft, and/or if additional deicing/anti-icing treatment are required.

CAUTION	- Make sure that the low or high-pressure ground connectors do not supply any external air to the aircraft. - If it is necessary for the ground crew to repeatedly anti-ice the aircraft, they must deice the surfaces with a hot fluid mixture before applying a new layer of anti-icing fluid.

COMMUNICATION WITH GROUND CREW..ESTABLISH

L2 *Establish communication with the crew that will apply the procedure.*

L1 DEICING/ANTI-ICING FLUIDS TYPE..CHECK APPROPRIATE

L2 *Check that the ground crew uses the correct deicing/anti-icing fluids, in accordance with the applicable operator requirements and AMM.*

L1 DO NOT START THE ENGINES DURING FLUID SPRAYING

L2 *Engines and APU can be either stopped or running during deicing/anti-icing.*

L1

CAUTION	- The ground crew should take care when spraying deicing fluid, and make sure that the engines and APU do not ingest any fluid. - Do not move flaps, slats, ailerons, spoilers or elevators if they are not free of ice. - Always ensure that both left and right side of the aircraft receive the same complete and symmetrical deicing/anti-icing treatment.

Note: *In case of frost formation on one or several areas of the wing, the Captain can request a local deicing application only on the affected areas. The Captain shall take care that both wings receive the same symmetrical treatment, even if frost formation does not affect both wing symmetrically. For more information, refer to AMM.*

CABIN PRESS MODE SEL..CHECK AUTO
ENG 1 BLEED..OFF
ENG 2 BLEED..OFF
APU BLEED..OFF
DITCHING pb..ON

L2 *Outflow valve, pack valves, and avionic ventilation inlet and extract valves close.*

This prevents deicing/anti-icing fluid from entering the aircraft. Avionic ventilation is in a closed circuit with both fans running. In view of the low OAT, there is no time limit for this configuration.

L1 *Note:* 1. *If the VENT AVNCS SYS FAULT alert appears, reset the AEVC circuit breaker at the end of the aircraft deicing/anti-icing procedure.*
AIR COND/AVNCS/VENT/MONG Y17 on 122 VU.
2. *For passenger comfort reason, it is not recommended to operate on ground with both PACKS set to OFF for more than 20 min.*

1 **Applicable to: MSN 01143-11293**

UPON COMPLETION OF THE SPRAYING OPERATION

PITOTS and STATICS (ground crew).......................CHECK

CAUTION	When the OAT is low (below -5 °C) during snow/freezing rain precipitations , melted snow or raindrops may drip from the cockpit windshields and freeze on the fuselage below. This could create ice build up on the forward fuselage that could possibly disturb the airflow around the static/pitot/angle-of-attack probes, and result in unreliable air data measurements during takeoff. Therefore, during taxi out before takeoff, beware of this possible build up of ice. The area around static/pitot/angle-of-attack probes must be free of ice/snow before starting takeoff.

GROUND EQUIPMENT.......................REMOVE

DEICING/ANTI-ICING REPORT..........RECEIVED

The information from ground personnel, who performed the deicing/anti-icing and post-application check, must include (ANTI-ICING CODE):

- *The type of fluid used*
- *The ratio of fluid to water (e.g. 75/25)*
- *The time of the holdover beginning*
- *The result of the post application check: "Aircraft critical parts are clean".*

DITCHING pb..........OFF
OUTFLOW VALVE..........CHECK OPEN

On the ECAM PRESS page, confirm that the outflow valve indication reaches the open green position to avoid any unexpected aircraft pressurization.

● **At least 1 minute after completion of spraying operations:**

ENG BLEED 1..........ON
ENG BLEED 2..........ON

● **At least 5 minutes after completion of spraying operation:**

APU BLEED..........AS RQRD

Note: *There is a risk of de-icing fluid ingestion by the APU air intake, resulting in specific odors, or smoke warnings. Therefore:*

- *Keep the APU running with the APU BLEED OFF for 5 min after spraying completion before setting the APU BLEED to ON (if required),*
- *Consider APU BLEED OFF for takeoff.*

NORMAL PROCEDURE..........RESUME

Apply appropriate normal procedures. Pay special attention to the flight control check. In freezing precipitation, perform the appropriate checks to evaluate aircraft icing. Base the decision on whether to takeoff, or to re-protect the aircraft, on the amount of ice that has built up on the critical surfaces since the last deicing/anti-icing, as revealed by a personal inspection from the inside and outside of the aircraft. Make this inspection before the holdover time expires, or just before takeoff.

PRELIMINARY COCKPIT PREPARATION

PRELIMINARY COCKPIT PREPARATION - SOP....COMPLETED

L2 APU is started and the air conditioning is on.

Note: - *Ground power should be used to start the APU if the OAT is -15 °C (5 °F) or below.*
- *With cockpit temperatures below -15 °C (5 °F), the display units may not be available.*

L1 ● **If the avionics bay is cold soaked:**

L2 The aircraft was parked without electrical ground supply or without air conditioning.

L1 IRS....INITIATE ALIGNMENT

L2 For temperatures at or below -15 °C (5 °F) in the avionics bay, the IRS alignment requires 15 min.

L1 WINDSHIELD AND UPPER COCKPIT FUSELAGE....ICE/SNOW REMOVED

CAUTION	With ice or snow accumulated on the windshield and/or the upper cockpit fuselage, and if the PROBE/WINDOW HEAT is on, melted ice or snow running down from these areas could re-freeze on the fuselage area below, if the temperature is very low. This could create ice build-up on the forward fuselage that could possibly disturb the airflow around the static/pitot/angle-of-attack probes.

PROBE COVERS.... CHECK REMOVED

L2 Ensure that the probe covers are removed in order to prevent the covers from melting.

L1 PROBE/WINDOW HEAT....ON

AFTER START

- **After first engine start:**
  PROBE/WINDOW HEAT pb.. AUTO
  L2 *Heating will continue to operate automatically.*
  L1 NORMAL PROCEDURE.. RESUME
  - **If external temperature is less than or equal to -20 °C (-4 °F), perform the following actions after both engines are started:**
    ENG MODE selector.. NORM

Wait 10 s

L2 Automatic engine shutdowns have been experienced under very low temperatures. This automatic engine shutdown is caused by a transient high bleed extraction on one of the engines combined with a slow SAV / PRV closing/opening sequence when starting the last engine. To avoid this automatic engine shutdown, it is requested to wait 10 s to ensure that the SAV 1 is properly closed after AVAIL indication is displayed and before switching off the APU BLEED.

L1 APU BLEED pb-sw.......................................OFF

- **After first engine start:**
  PROBE/WINDOW HEAT.......................................AUTO

L2 Heating will continue to operate automatically.

L1 NORMAL PROCEDURE.......................................RESUME

Ident.: PRO-NOR-SUP-ADVWXR-B-00021770.0001001 / 13 JUN 17
Applicable to: MSN 08495-09324, 10949-11139

TAKEOFF

- **If OAT below -40 °C (-40 °F), perform the following action before takeoff:**
  THRUST REVERSERS.......................................PERFORM 5 CYCLES

L2 To perform 1 cycle, put the thrust levers to REV IDLE and maintain until the REV indication on the Engine/Warning display becomes green. Then put the thrust levers back to IDLE and wait for the REV indication to disappear before the next cycle.

Note: *1. Takeoff has to be initiated within one minute after the last thrust reversers cycle.*
2. If the takeoff is not performed within one minute after the last thrust reversers cycle, repeat each time the 5 thrust reversers cycles.

Ident.: PRO-NOR-SUP-ADVWXR-B-00021770.0002001 / 23 FEB 18
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

TAKEOFF

- **If OAT below -40 °C (-40 °F), perform the following action before takeoff:**
  THRUST REVERSERS.......................................PERFORM 6 CYCLES

L2

To perform 1 cycle, put the thrust levers to REV IDLE and maintain until the REV indication on the Engine/Warning display becomes green. Then put the thrust levers back to IDLE and wait for the REV indication to disappear before the next cycle.

Note: *1. Takeoff has to be initiated within one minute after the last thrust reversers cycle.*
2. If the takeoff is not performed within one minute after the last thrust reversers cycle, repeat each time the 6 thrust reversers cycles.

GROUND OPERATIONS IN HEAVY RAIN

Ident.: PRO-NOR-SUP-ADVWXR-00020720.0001001 / 21 MAR 17
Applicable to: ALL

On ground (Aircraft taxiing or parked) in case of heavy rain, water may enter the avionics ventilation system via the skin air inlet valve.

- **When on ground:**

  EXTRACT...OVRD

L2

  This closes the skin air inlets, preventing rainwater from entering the avionics bay.

L1

  PACK 1 ON...CHECK
  PACK 2 ON...CHECK

L2

  Air conditioning compensates the avionics cooling reduction when the skin air inlet is closed.

L1

  - **If air conditioning not available:**

L2

    When the aircraft avionics are powered, closing the skin air inlet valve reduces avionics cooling capability. With air conditioning not available, the reduced cooling is efficient for a limited period of time, depending on the outside temperature.

L1

    Aircraft should not remain powered more than:
    - OAT ≤ 39 °C (102 °F): no limit
    - 39 °C (102 °F) < OAT ≤ 45 °C (113 °F): 3 h
    - 45 °C (113 °F) < OAT: 30 min

- **After takeoff:**

  EXTRACT...AUTO

MINIMUM SPEED WITH ICE ACCRETION

Ident.: PRO-NOR-SUP-ADVWXR-00020722.0002001 / 21 MAR 17
Applicable to: MSN 01143-01246, 01376-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11139

Evidence of ice accretion can be ice on the visual indicator (between the two cockpit windshields) or on the windshield wipers.

CAUTION	Extended flight in icing conditions with the slats extended should be avoided.

- **If wing anti ice is operative:**
  - **In CONF clean, 1, 2 or 3:**
    MIN SPEED: VLS + 10 kt
  - **In CONF FULL:**
    MIN SPEED: VLS + 5 kt

  The minimum speed takes into account ice accretion on non-heated structure.
- **If wing anti ice is not operative:**
  MIN SPEED: VLS + 10 kt/GREEN DOT

  The minimum speed takes into account ice accretion on the entire airframe when anti-ice is inoperative.

MINIMUM SPEED WITH ICE ACCRETION

Ident.: PRO-NOR-SUP-ADVWXR-00020722.0001001 / 21 MAR 17
Applicable to: MSN 01251

Evidence of ice accretion can be ice on the visual indicator (between the two cockpit windshields) or on the windshield wipers.

CAUTION	Extended flight in icing conditions with the slats extended should be avoided.

- **If wing anti ice is operative:**
  - **In CONF clean, 1, 2 or 3:**
    MIN SPEED: VLS + 10 kt
  - **In CONF FULL:**
    MIN SPEED: VLS + 5 kt

    The minimum speed takes into account ice accretion on non-heated structure.

- **If wing anti-ice is not operative:**
  - **In CONF clean:**

    MIN SPEED: VLS + 15 kt
  - **In CONF 1, 2, 3 or FULL:**

    MIN SPEED: VLS + 10 kt

    The minimum speed takes into account ice accretion on the entire airframe when anti-ice is inoperative.

OPERATIONS ON CONTAMINATED AIRPORTS

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-C-00020729.0001001 / 21 MAR 17

GENERAL

If the ground surfaces are not contaminated but the weather corresponds to icing conditions with falling rain, slush or snow, anticipate a probable resulting runway/surfaces contamination.
There is a low probability of fluid ingestion by the engines which should anyway not degrade the safety. The risk of ingestion is independent of the depth of the contaminant.

Ident.: PRO-NOR-SUP-ADVWXR-C-00020726.0002001 / 26 OCT 22

SPURIOUS ALERTS

The radio altimeter indication may fluctuate on contaminated surfaces and trigger auto callouts or GPWS warnings. These alerts can be disregarded.

Note: Spurious GPWS warnings may trigger at the apron, during taxi, takeoff and landing runs.

The radio altimeter may also not compute valid data:
- On surfaces covered with snow, ice or deicing fluid, and/or
- Due to deicing fluid on the antenna.

As a result, the "NAV RA 1(2)(1+2) FAULT" ECAM alert may be triggered.

This alert may disappear when the radio altimeter provides valid data again, when:
- The aircraft is on a non-contaminated surface, or
- The antenna is cleaned, or
- A period of time elapses after deicing, allowing the fluid covering the antenna to dry. The taxi time between deicing spot and holding point may be sufficient.

In any case, the "NAV RA 1(2)(1+2) FAULT" ECAM alert cannot be disregarded. The ISI article 34.42.00015 "Radio Altimeter (RA) - "NAV Rax FAULT" ECAM warning on ground" provides the instructions to manage this alert that triggers on ground on contaminated airports.

In addition, in case the "NAV RA 1(2)(1+2) FAULT" ECAM alert triggers, the following alerts may also trigger and may be disregarded:
- NAV TCAS FAULT
- NAV PRED W/S DET FAULT.

In case of invalid LGCIU information (e.g. ground information not transmitted by LGCIU), disregard the following alerts if triggered:
- ENG DUAL FAILURE or ENG ALL ENGINES FAILURE
- ANTI ICE CAPT(F/O) TAT FAULT
- L/G SHOCK ABSORBER FAULT
- STALL warning.

Ident.: PRO-NOR-SUP-ADVWXR-C-00020725.0001001 / 21 MAR 17

PARKING

- **After engine shutdown and before shutting down electrical supply:**

FLAPS/SLATS.. CONFIRM FREE OF CONTAMINATION

L2 Perform a visual inspection to determine if the flaps/slats mechanism is free of contamination. If necessary, perform decontamination.

L1 YELLOW ELEC PUMP pb.. ON
BLUE ELEC PUMP pb.. AUTO
BLUE PUMP OVRD pb.. ON
SLATS/FLAPS.. RETRACT

L2 *Monitor slats/flaps retraction on ECAM upper display.*

L1
- **When slats and flaps are retracted:**

  YELLOW ELEC PUMP pb.. OFF
  BLUE PUMP OVRD pb.. OFF
  NORMAL PROCEDURE.. RESUME

OPERATIONS WITH VOLCANIC ASH, SAND OR DUST

Ident.: PRO-NOR-SUP-ADVWXR-G-00020733.0001001 / 21 MAR 17
Applicable to: ALL

PRELIMINARY COCKPIT PREPARATION

APU.. AVOID USE

L2 *Request ground power for air conditioning and electricity. If ground power is not available, the APU should be used only to start the engines.*

L1 WINDSHIELD WIPERS.. DO NOT USE

L2 *Do not use the windshield wipers to remove ash, sand or dust.*

L1 ● **For takeoff performance:**

BRAKING PERFORMANCE MAY BE DEGRADED

L2 A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020734.0001001 / 21 MAR 17
Applicable to: ALL

EXTERIOR WALKAROUND

SURFACES AND EQUIPMENT..CHECK FREE OF DEPOSITS

L2 *Ground maintenance should remove ash, sand or dust that has settled on exposed lubricated surfaces and could penetrate seals or enter the engine gas path, air conditioning system, air data probes, access doors and panels and other orifices on the aircraft.*

L1 ENGINE/APU INLETS.. CHECK FREE OF DEPOSITS

L2 Inspect the inlets and order them cleaned of deposit. Have the area within 8 m (25 ft) of the engine inlet cleaned of volcanic ash, as much as practical.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020735.0001001 / 10 NOV 20
Applicable to: ALL

ENGINE START

ALL ENGINES..CRANK

L2 *Before engine start, ventilate all engines for 2 min by dry-cranking at the maximum motoring speed to remove any deposit from the booster area. Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking).*

L1 ■ **If air start unit is available:**

ENGINE START WITH AN AIR START UNIT..

Refer to PRO-NOR-SUP-ENG Engine Start with an Air Start Unit

■ **If air start unit is not available:**

SOP - ENGINE START..PERFORM

ENG 2 BLEED..ON

Ident.: PRO-NOR-SUP-ADVWXR-G-00020738.0004001 / 18 NOV 21
Applicable to: MSN 10949-11139

AFTER TAKEOFF

MINIMIZE TIME IN SAND OR DUST CLOUD

L2 *Climb to quickly exit the sand/dust cloud. If possible, altitude constraints may be disregarded in coordination with ATC.*

L1 ENG 1 BLEED..ON
ENG 2 BLEED..ON

Note: The AIR ENG 1+2 BLEED FAULT alert triggers if both ENG BLEED pb-sw are still OFF above 1 500 ft. If this occurs, disregard this alert.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020739.0001001 / 21 MAR 17
Applicable to: ALL

IN FLIGHT

AVOID ASH, SAND OR DUST CLOUD

- **If sand or dust cloud encounter:**

  MINIMIZE TIME IN SAND OR DUST CLOUD

L2 *If possible and in coordination with ATC, adapt flight path (route and altitude) to exit the cloud.*

L1

- **If ash cloud encounter:**
  VOLCANIC ASH ENCOUNTER PROCEDURE.. APPLY

  Refer to PRO-ABN-MISC [QRH] VOLCANIC ASH ENCOUNTER .

Ident.: PRO-NOR-SUP-ADVWXR-G-00020740.0001001 / 21 MAR 17
Applicable to: ALL

DESCENT PREPARATION

AUTOLAND RECOMMENDED

L2 *Deposits on the windshield and landing lights may significantly reduce visibility during approach and landing. Consider a diversion to an airport where autoland is possible.*

L1

- **For landing performance:**
  CONSIDER IDLE REVERSE
  BRAKING PERFORMANCE MAY BE DEGRADED

L2 *A layer of volcanic ash, sand or dust on the runway may degrade the braking efficiency.*

Ident.: PRO-NOR-SUP-ADVWXR-G-00020741.0001001 / 21 MAR 17
Applicable to: ALL

DESCENT

AVOID LEVEL FLIGHT IN ASH, SAND OR DUST CLOUD

If possible and in coordination with ATC, perform holding patterns and last level off before final descent outside of the cloud.

Ident.: PRO-NOR-SUP-ADVWXR-G-00020742.0001001 / 21 MAR 17
Applicable to: MSN 01251, 02014, 06561

LANDING

- **Before Landing:**
  ENG 1 BLEED.. OFF
  ENG 2 BLEED.. OFF
  PACK 1 and 2...AS REQUIRED

L2 *Consider to set the packs OFF in order to avoid contamination of the air conditioning system.*

L1

- **During Landing:**
  REVERSERS..AS REQUIRED

L2 *If it appears that maximum reverse thrust is needed, apply reverse thrust when the main landing gear touches down. Limit the use of reverse thrust as much as possible, because reverse flow may throw up ash, sand or dust and impair visibility.*

Ident.: PRO-NOR-SUP-ADVWXR-G-00020742.0002001 / 28 MAY 20
Applicable to: MSN 01143-01246, 01376-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321, 02734-03710, 03733-05987, 06097, 06121, 06139-06536, 06592-09324, 10949-11139

LANDING

- **Before Landing:**
  ENG 1 BLEED.. OFF
  ENG 2 BLEED.. OFF

  Note: The AIR ENG 1+2 BLEED FAULT alert triggers when both ENG BLEED pb-sw are set to OFF. When this occurs, disregard this alert.

  PACK 1 and 2.. AS RQRD

L2 *Consider to set the packs OFF in order to avoid contamination of the air conditioning system.*

L1
- **During Landing:**
  REVERSERS.. AS RQRD

L2 *If it appears that maximum reverse thrust is needed, apply reverse thrust when the main landing gear touches down. Limit the use of reverse thrust as much as possible, because reverse flow may throw up ash, sand or dust and impair visibility.*

SECURING THE AIRCRAFT

If the aircraft is parked at an airport covered with volcanic ash, sand or dust, install engine inlet covers and other protective covers and plugs.
In addition:

- **After switching off all bleeds and before switching off the electrical AC power:**
  DITCHING pb.. ON

L2 *This closes the outflow valve, pack valves and avionics ventilation inlet and extract valves.*

L1 ● **After switching off the electrical AC power and the batteries:**
DITCHING pb..OFF

L2 *All the applicable valves will open at the next power-up.*

L1 PROTECTIVE COVERS..INSTALL

L2 Request ground crew to install protective covers and plugs, in order to protect the aircraft and engines from volcanic ash, sand or dust.

L1 LOGBOOK..REPORT ASH, SAND OR DUST CLOUD ENCOUNTER

SECURING THE AIRCRAFT FOR COLD SOAK

Ident.: PRO-NOR-SUP-ADVWXR-00020772.0001001 / 28 MAY 20
Applicable to: ALL

Cold soak should be considered in the following conditions:
- The OAT is less than 0 °C (32 °F), and
- No electrical supply and no air conditioning are provided to the aircraft, and
- The temperatures of aircraft components decrease below 0 °C (32 °F).

WHEN SECURING THE AIRCRAFT

● **After switching off all bleeds and before switching off the electrical AC power:**
DITCHING pb .... ON

L2 *This closes the outflow valve, pack valves and avionics ventilation inlet and extract valves.*

L1 ● **When the chocks are in place:**
PARKING BRAKE handle ....OFF

L2 *Releasing the parking brake prevents the brakes from freezing.*

L1 ● **After switching off the electrical AC power and the batteries:**
DITCHING pb ....OFF

L2 *All the applicable valves will open at the next power-up.*

L1 PROTECTIVE COVERS..INSTALL

L2 *Request ground crew to install protective covers and plugs, in order to protect the wheels, the engines and the probes from snow and ice.*

L1 WATER SYSTEM DRAINING..REQUEST

L2 *Request maintenance actions to drain the water system for cold soak prevention purposes.*
Refer to PRO-NOR-SUP-ADVWXR Water System Draining.

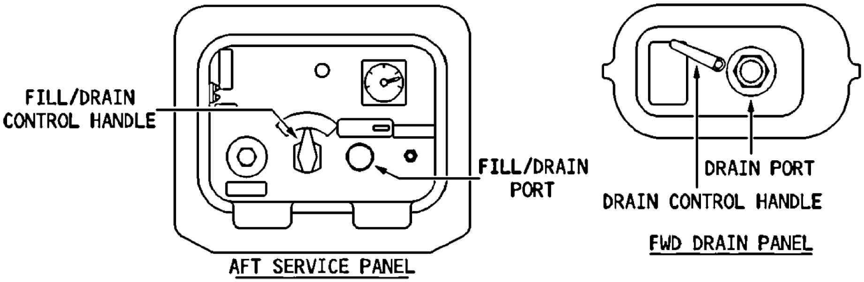
FOR DRAINING WATER PROCEDURE

Applicable to: ALL

Ident.: PRO-NOR-SUP-ADVWXR-D-00002313.0001001 / 21 MAR 17

INTRODUCTION

This procedure uses electrical power.



ACCESS PLATFORM(S)....................PUT IN POSITION
SHUTOFF VALVE IN GALLEYS/TOILETS....................CHECK OPEN
FWD/AFT ACCESS PANEL DOORS....................OPEN
DRAIN PORT CAPS....................REMOVE

Remove drain port caps on forward drain and aft service panels.

DRAIN HOSES....................CONNECT

Connect drain hoses to :

- *the drain port on the forward drain panel.*
- *the full/drain port on the aft service panel.*

Ident.: PRO-NOR-SUP-ADVWXR-D-00002314.0001001 / 21 MAR 17

ON THE FORWARD DRAIN PANEL

DRAIN CONTROL HANDLE....................TURN LEFT

Turn the control handle to drain.

Ident.: PRO-NOR-SUP-ADVWXR-D-00002315.0001001 / 21 MAR 17

ON THE AFT SERVICE PANEL

FILL/DRAIN CONTROL HANDLE....................TURN TO “DRAIN” AND PULL

Turn the handle to the “DRAIN” position and pull it out to its mechanical stop to drain.
The indicator light comes on.

Ident.: PRO-NOR-SUP-ADVWXR-D-00002316.0001001 / 21 MAR 17

WHEN THE WATER SYSTEM IS DRAINED

In freezing conditions, the drain valves must stay open to prevent damage to the system. Do not put on the caps and leave the access door open.

DRAIN HOSES....................DISCONNECT
PANELS....................CLEAN AND DRY
ACCESS PLATFORM(S)....................REMOVE

WATER SYSTEM DRAINING

Ident.: PRO-NOR-SUP-ADVWXR-00002205.0001001 / 21 MAR 17
Applicable to: ALL

Drain the water system, if the OAT requires it, as shown below :

Configuration			**Exposure time**	**Water tank drain**
Air Conditioning	**Cabin temperature**	**Outside Air Temperature**		
ON	Above 10 °C (50 °F)	Between 0 °C and -15 °C (32 °F and 5 °F)	None	Not required
		Below -15 °C (5 °F)	1 h 15 min	Required
OFF		Between 0 °C and -7 °C (32 °F and 19.4 °F)	1 h 30 min	
		Between -7 °C and -15 °C (19.4 °F and 5 °F)	0 h 30 min	
		Below -15 °C (5 °F)	Any	

Intentionally left blank

MANUAL ENGINE START

Ident.: PRO-NOR-SUP-ENG-A-00009443.0004001 / 24 OCT 22
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases:

- **After aborting a start, because of:**
  - Engine stall
  - Engine EGT overlimit
  - Low start air pressure
- **When expecting a start abort, because of:**
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin, in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.
  - Intermittent ECAM ENG 1(2) IGN A(B) FAULT alert, during the first start of the day.

Ident.: PRO-NOR-SUP-ENG-A-00009443.0002001 / 24 OCT 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases :

- **After aborting a start, because of :**
  - Engine stall, or Engine EGT overlimit, or LO START AIR PRESS, or No N1 rotation, or Hung start.
- **When expecting a start abort, because of :**
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin, in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.
  - Tailwind greater than 10 kt
    Starting in tailwind may fail due to N1 counterrotation, hot gas black flow. Fuel should be set to ON at N2 max motoring speed, provided N1 has stopped, and turn clockwise. (confirmation by the ground crew).

Ident.: PRO-NOR-SUP-ENG-A-00009443.0005001 / 24 OCT 22
Applicable to: MSN 08495-09324, 10949-11139

Pilots normally use automatic starting to start an engine.

However, manual starting is recommended in the following cases:

- **After aborting a start, because of:**
  - Engine stall
  - Engine EGT overlimit
  - Low start air pressure
  - Hung start
- **When expecting a start abort, because of:**
  - Degraded bleed performance, due to hot conditions, or at a high-altitude airfields.
  - An engine with a reduced EGT margin, in hot conditions, or at a high-altitude airfields.
  - Marginal performance of the external pneumatic power group.

MANUAL ENGINE START PROCEDURE

Note: *During a manual engine start, if the flight crew suspects an engine start malfunction, or if an engine-related ECAM alert is triggered, the PF must abort the start sequence as follows:*

- *Before the ENG MASTER lever is set to ON, the PF must set the ENG MAN START pb-sw to OFF*
- *After the ENG MASTER lever is set to ON, the PF must set the ENG MASTER lever to OFF, and then the ENG MAN START pb-sw to OFF.*
  In that case, the flight crew should consider a dry crank cycle of the affected engine before they perform another start attempt (Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)).

Then, in the case of an ECAM alert, the PF must announce "ECAM actions", in accordance with the ECAM management philosophy.

THR LEVERS..IDLE

CAUTION	The engines start regardless of the thrust lever position. If the thrust levers are not set to IDLE, the thrust rapidly increases to the corresponding thrust lever position, causing a hazardous situation.

ENG MODE sel.. NORM THEN IGN/START

L2 *The lower ECAM displays the engine page.*

L1 *Note:* *If both engines are started manually, the following procedure applies one engine at a time.*

- **When all engines parameters (except N1 and N2) are available on the upper ECAM display (no amber crosses displayed):**

  ENG MAN START pb-sw.......... ON
  START VALVE.......... CHECK IN-LINE
  N2 INCREASE.......... CHECK
  OIL PRESS INCREASE.......... CHECK

  - **If the N2 does not reach 16 %:**

    PACK VALVES.......... CHECK CLOSED

    - **If the APU bleed is used for engine start and the pack valves are closed, shed the APU electrical loads as follows:**

      L2 Shedding APU electrical loads enables to increase bleed air pressure.

      L1 GALY & CAB.......... OFF

      - **If needed, shed also:**

        BLUE ELEC PUMP (on ground only).......... OFF
        FUEL X FEED.......... ON
        FUEL PUMPS (except R TK PUMP 2).......... OFF
        BLOWER.......... OVRD
        CAB FANS.......... OFF

        - **If additional shedding is required:**

          HYD ENG PUMP.......... OFF

          Return the hydraulic engine pump to ON for second engine start, to permit PTU auto test.

- **When N2 reaches the maximum motoring speed (16 % minimum) and 30 s after selection of the ENG MAN START pb-sw:**

  Note: *The maximum motoring speed is reached when a significant decrease in N2 acceleration is observed.*
  Do not attempt to start unless N2 is at least 16 %.

  In hot weather conditions (OAT at or above 40 °C / 104 °F):
  - If the residual EGT is above 100 °C, perform a 2 min dry crank in order to reduce the residual EGT to the minimum achievable. *Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)*. Following the dry crank if the residual EGT is below 250 °C, the manual start can be attempted after a 15 s wait time for starter lubrication.
  - Starting with a residual EGT above 250 °C is not recommended.

  ENG MASTER.......... ON
  CHRONO.......... START

  L2 *The PM starts the timing in order to monitor the light-up duration.*

L1 IGNITERS A AND B.. CHECK ON
FUEL FLOW INCREASE...CHECK

L2 *With current EEC standard, fuel flow indication spiking occurs at fuel on.*

L1
- **20 s maximum after fuel flow increase:**

  EGT INCREASE... CHECK
  N1 INCREASE (before 34 % N2)...CHECK

  If the electrical power supply is interrupted during the start sequence (indicated by the loss of ECAM displays), abort the start by setting the ENG MASTER lever to OFF. Then perform a 30 s dry crank *Refer to PRO-NOR-SUP-ENG Engine Ventilation (Dry Cranking)*.

- **When N2 reaches 43 %:**

  IGNITERS A AND B (at 43 % N2)...CHECK OFF
  START VALVE (slightly above 43 % N2)...CHECK CROSS LINE
  MAIN ENG PARAMETERS...CHECK NORMAL
  SECONDARY ENG PARAMETERS... CHECK NORMAL

L2 *The gray background on the N2 indication disappears.*

AIR CONDITIONING DURING AUTOMATIC ENGINE START

Ident.: PRO-NOR-SUP-ENG-00021159.0002001 / 04 MAY 18
Applicable to: MSN 08495-09324, 10949-11139

During automatic engine start, the FADEC commands a dry crank that may significantly extend the engine start duration. This procedure enables to use the air conditioning during the start sequence of the engine 1 in order to enhance passenger's comfort.
This procedure can only be used if engine 2 is started before engine 1, as per Standard Operating Procedures, with APU bleed or external pneumatic power.

NORMAL PROCEDURE.. RESUME

ENGINE START VALVE MANUAL OPERATION

Ident.: PRO-NOR-SUP-ENG-00020861.0010001 / 17 MAR 17
Applicable to: MSN 08495-09324, 10949-11139

BEFORE ENGINE START

Before the manual override of the start valve, respect the below minimum time after the last engine shutdown:

Airport Elevation (ft above Sea Level)	Minimum Engine Shutdown Time (h) (1)
4 000 and below	9
4 001 to 5 000	9.5
5 001 to 10 000	10
Above 10 000	10.5

(1) *These times apply only for engines that have performed normal flight operations and have followed the recommended 3 min idle cool down prior to shutdown. If not operated in this manner, 12 h must be observed.*

Advise ground crew to prepare for manual engine start valve operation.

WARNING	To ensure safety of the ground crew when starting an engine with manual operation of the start valve, the flight crew should start the affected engine first.

ENGINE VENTILATION (DRY CRANKING)

Ident.: PRO-NOR-SUP-ENG-00020943.0003001 / 17 MAR 17
Applicable to: MSN 08495-09324, 10949-11139

On ground, after:
- An unsuccessful manual engine start, or
- An unsuccessful automatic start not followed by an automatic dry crank,

the flight crew can perform a dry crank cycle on the affected engine to remove the fuel vapors.

- **Before dry crank:**
  ENG MASTER (affected engine)........ CHECK OFF
  ENG MODE sel........ CHECK NORM
  ENG MAN START pb-sw (affected engine)........ CHECK OFF
- **Dry crank:**
  ENG MODE sel........ CRANK
  ENG MAN START pb-sw (affected engine)........ ON

Note: *To clear fuel vapors, a 30 seconds dry crank cycle is the minimum required.*

L2 Note: *A manual start sequence can be initiated following a dry crank cycle (Refer to PRO-NOR-SUP-ENG Manual Engine Start - Procedure). The flight crew should consider the starter limitations (Refer to LIM-ENG Starter).*

Note: *Depending on the engine thermal state, the FADEC can command an automatic dry cranking (or engine cooling) with the associated COOLING indication displayed on the E/WD. Refer to DSC-70-80-40 Engine CoolingAfter approximately 2 min, the automatic bowed rotor protection cranking stops, the N2 value is no longer limited at around 10% and increases up to the maximum motoring speed. At the same time, the COOLING indication disappears from the E/WD.*

L1
- **When the dry crank is completed:**
  ENG MAN START pb-sw (affected engine)........ OFF

ENG MODE sel..NORM

ENGINE START USING AIR SUPPLIED BY ANOTHER A320

Applicable to: MSN 02321, 02887

Ident.: PRO-NOR-SUP-ENG-B-00009615.0002001 / 26 NOV 14

GENERAL

This procedure allows the engine to be started by using air supplied by another A320 aircraft.
A special tool is required to override the non-return valve, fitted on the HP ground connector of the supplying aircraft.
The aircraft should be positioned so that the HP bleed hose does not run through engine hazard areas.

Ident.: PRO-NOR-SUP-ENG-B-00009590.0002001 / 16 NOV 11

REFUELING

Ident.: PRO-NOR-SUP-FUEL-A-00021256.0002001 / 25 JUL 17
Applicable to: ALL

WARNING

1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft.
2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed.
3. f the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*.
4. Do not refuel in bad weather conditions and electrical storms.

PREPARATION

SAFETY PRECAUTIONS....................................APPLY

During refueling operations, ensure that:
- *HF transmission (including HF transmission via the HF DATA LINK pb) is not performed*
- *The aircraft is properly bonded to the tanker*
- *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft.*
- *The external lighting is not operated (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM....................................IN POSITION

REFUELING WITH ONE ENGINE RUNNING

Ident.: PRO-NOR-SUP-FUEL-00001677.0003001 / 21 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11139

- Refuel with one engine running only at airports where no external ground pneumatic power is available and only when APU is unserviceable.
- Only the RH fuel couplings can be used.
- Overwing gravity filling is not permitted.
- Disembark all passengers.
- Obtain airport authorization.
  The Airport Fire Department should standby at the aircraft during the entire refueling procedure.
- Point the aircraft into the wind at a location where the slope is negligible.
  Set the parking brake and check its pressure.
  Run engine n° 1 at ground idle with its generator connected.
- Do not start engine n° 2, do not shut down engine n° 1 or do not attempt to start the APU before all fueling operations have been completed.
- Position the fuel truck under the extremity of the right wing. Its pressure should not exceed 30 PSI.
- Follow manual refueling procedure.

OPERATION MONITORING

DURING THE ENTIRE REFUELING PROCEDURE :

- Monitor the fuel truck shut off valve.
- Be sure that the fueling company is keeping permanent control of the emergency fuel shut off device.

- Have a flight crew member in the cockpit monitoring all systems and the running engine.
- Have a qualified ground crew member at the fueling station to operate the refuel valve switches.
- Monitor the refueling closely and be prepared to close the refuel valves in order not to exceed the following fuel quantities :

DENSITY (kg/l)	0.77	0.78	0.79	0.8	0.81	0.82	0.83
L(R) WING (kg)	5 710	5 780	5 860	5 930	6 005	6 080	6 160
CENTER (kg)	6 030	6 110	6 190	6 270	6 350	6 430	6 500

AFTER SECOND ENGINE START :

- **Reset the 3DMCs in order to reinitialize the fuel used values :**

WARNING

1. Prior initiation of any ground fuel operations, obey the below fuel safety precautions. This will prevent injury to people and/or damage to the aircraft.
2. Do not request or perform any ground fuel operations if a fire or engine overheat warning is displayed.
3. If the APU fails during any ground fuel operations, do not restart the APU. For APU use during refueling/defueling *Refer to LIM-APU APU Start/Shutdown during Refueling/Defueling*.
4. Do not defuel in bad weather conditions and electrical storms.
5. Defueling by suction is not possible. Fuel can be removed from inner tank only. To defuel center tank, first transfer fuel to the inner tanks.

SAFETY PRECAUTIONS...APPLY

During defueling operations, ensure that:
- *HF transmission (including HF transmission via the HF DATA LINK ◁ pb) is not performed*
- *The aircraft is properly bonded to the tanker*

- *The tanker and the aircraft grounding requirement is based on local regulations. Always connect the ground cable to the parking ground point (or to the tanker) before connecting it to the aircraft*
- *The external lighting is not operated (except for NAV & LOGO).*

In the cockpit, check that the PARK BRK is ON and that the ACCU PRESS has sufficient pressure. If the PARK BRK cannot be set to ON, check that the chocks are in place.

ACCESS PLATFORM..........IN POSITION

GPS INTERFERENCES

Ident.: PRO-NOR-SUP-GPSINT-A-00025101.0001001 / 26 JAN 22
Applicable to: ALL

Radio frequency interferences can affect the GPS data and the aircraft functions that use GPS data. Due to the various levels of interference, the GPS data can be maintained, degraded or lost. The associated sequence of cockpit effects cannot be predicted.
The following table provides a list of cockpit effects that may occur during the GPS interferences:

Ident.: PRO-NOR-SUP-GPSINT-A-00025102.0001001 / 26 JAN 22

Wind information	Erroneous wind speed and direction.			

Ident.: PRO-NOR-SUP-GPSINT-A-00025103.0001001 / 26 JAN 22
Applicable to: ALL

When the flight crew suspects some GPS interferences due to the cockpit effects, the flight crew can check the GPS data.
The GPS MONITOR page displays dashes on GPS positions, and/or the number of tracked satellites may be lower than 5 or null, in the case of GPS interferences.
The flight crew should keep the GPS selection on the SELECTED NAVAIDS page. This allows the aircraft to recover the degraded or lost functions based on GPS data (e.g. GPS PRIMARY), as soon as the aircraft is out of the interferences.
When ADS-B OUT is required in the flight area, the flight crew should notify ATC of any loss of ADS-B OUT.

■ If NOTAMs (from Authority or Company) indicate a GPS interference area, and the aircraft is expected to fly in or near interference zone:

● Flight Preparation

The flight crew should consider the following:
- The possibility to identify the entry and exit points of the interference area
- The possible effects of GPS interferences on flight operations
- The availability of alternate routes
- The availability of routes, procedures and approaches that do not require GPS (e.g. ILS, VOR/DME) for the affected area. *Refer to PRO-SPO-51 General - General*.

● Preliminary Cockpit Preparation

Perform a complete IRS alignment if the flight crew expects long segments in airspaces with low radio NAVAIDS coverage.

● Before the Interference Area (Before Departure or during the Flight)

In order to maintain the ATC datalink communication (ADS-C, CPDLC and PBCS) and the FMS predictions, the flight crew should apply the following:

CLOCK.. INT

L2 *If the clock was previously synchronized with the GPS, the INT mode of the clock maintains the ATC datalink capabilities for 24 h.*

L1

● After the Interference Area

GPS MODE.. CHECK

L2 *Check that the GPS MONITOR page displays GPS 1 in NAV mode with at least 5 satellites tracked.*

L1 CLOCK.. GPS

L2 *The clock should remain on INT mode until the GPS NAV mode is recovered.*

L1

■ If no NOTAMs indicate a GPS interference area on the expected route and the flight crew suspects interference on the GPS during the flight:

The flight crew should notify ATC of any interference on the GPS.

During the flight, the flight crew may detect an erroneous time reference due to suspected GPS interferences. In order to maintain the FMS predictions, the flight crew should consider the following:

ATC.. TIME CHECK

L2 *Crosscheck the external time reference with the clock.*

L1

- **If the ATC time is different from the time displayed on the clock:**

  CLOCK...SET

  Note: *Manually enter the time data on the clock, based on the external time reference. When the clock is in the SET mode, the flight crew should consider that the ATC datalink communication (CPDLC, ADS-C and PBCS) is unavailable.*

  - **After the Interference Area**

    GPS MODE... CHECK

    L2 *Check that the GPS MONITOR page displays GPS 1 in NAV mode with at least 5 satellites tracked.*

    L1 CLOCK... AUTO

    L2 *The clock should remain in SET mode until the GPS NAV mode is recovered.*

Flight With Landing Gear Down

FLIGHT WITH LANDING GEAR DOWN

Ident.: PRO-NOR-SUP-LG-LG_DN-SUP-LG-00023362.0001001 / 17 NOV 20
Applicable to: ALL

This chapter applies to dispatch with L/G down. A revenue flight is permitted with the L/G down, and the L/G gear doors closed in the conditions stated below.

EN-ROUTE

DRIFT-DOWN SPEED : GDOT – 5KT

L2 *The flight crew should use GDOT - 5 kt instead of Green Dot as drift-down speed.*

L1 EO MAX ALT... COMPUTE

L2 *The EO MAX ALT displayed by the FMS does not take into account the extended position of the L/G. The flight crew should use an alternate source to determine the EO maximum altitude.*

L1 *Note:* *In the Airbus IN-FLT PERF application (DES (OEI) panel):*

- *Select the "L/G DISPATCH WITH GEAR DOWN" NON STD CONF item*
- *Select DES TYPE: OBSTACLE and SPD TYPE: Green Dot for a descent at drift-down speed, or DES TYPE: EO STANDARD for a descent at fixed speed.*

FAILURE OF BOTH ENGINES

When both engines are failed, to ease the handling of all the different ECAM procedures resulting from this all engine flame out situation, it is recommended to use the ENG DUAL FAILURE QRH procedure, and if time permits, to clear the ECAM.
Follow all the steps of the QRH procedure, except those that are modified by the procedure below:

■ If APU is available:

- Perform an assisted relight, when below FL 200
- Flight controls are in direct laws. Use manual pitch trim as necessary (not indicated on PFD if APU GEN is not available).

■ If APU is not available:

- Attempt an APU start
- If APU start is unsuccessful, a windmilling relight can be performed, as long as the speed is above 260 kt (corresponding N2 above 18 %). In this case, increase the aircraft speed and disregard VMO warning.

Operation with Nosewheel Steering Offset

OPERATION WITH NOSEWHEEL STEERING OFFSET

Applicable to: ALL

Ident.: PRO-NOR-SUP-LG-LG-A-00020945.0001001 / 17 MAR 17

During taxi in a straight line, the crew may notice aircraft veering tendency. This can be due to external conditions (crosswind, slope....), or to a nosewheel steering offset.
A nosewheel steering offset is usually notified through consecutive crew reports. The NWS offset value is determined regarding the necessary rudder trim input used to cancel the veering tendency.

Ident.: PRO-NOR-SUP-LG-LG-A-00020946.0001001 / 17 MAR 17

When the NWS offset is within admissible limits, the flight crew can operate the aircraft as follows:

CAUTION	A rudder trim reset must be performed before takeoff. When the rudder trim adjustment is above the maintenance tolerance (±0.5 ° NWS offset corresponding to ±3 ° rudder trim necessary to taxi straight), the flight crew must systematically and accurately report the rudder trim value in the logbook.

NWS Offset	Necessary Rudder Trim Input	Procedure
Offset ≤ 0.5 °	Trim ≤ 3 °	● **Taxi:** RUDDER TRIM..ADJUST Adjust trim until the aircraft taxies in a straight line. Check input value. ● **Before takeoff:** RUDDER TRIM..RESET
0.5 ° < Offset ≤ 1.5 °	3 ° < Trim ≤ 8.8 °	● **Taxi:** RUDDER TRIM..ADJUST Adjust trim until the aircraft taxies in a straight line. Check input value. ● **Before takeoff:** RUDDER TRIM..RESET ● **Landing:** ● **For autoland:** MAX CROSSWIND..10 kt
Offset > 1.5 °	Trim > 8.8 °	MAINTENANCE ACTION...REQUEST Do not attempt takeoff. Request for troubleshooting.

DURING COCKPIT PREPARATION

FLIGHT PLAN INITIALIZATION

MAX SPEED: 250 kt
MAX CRZ FL: 100/MSA

If the altitude of the aircraft cabin reaches 14 000 ft, the cabin oxygen masks will automatically drop.

The flight crew must decide the minimum aircraft altitude, depending on:
- The MSA
- Oxygen requirements
- Turbulence, that can be uncomfortable for passengers
- Possible low OAT, that can be uncomfortable for passengers when the aircraft is ventilated by emergency ram air only.

● **If aircraft cruise FL is above FL 95:**

EXPECT CAB PR EXCESS CAB ALT ALERT

● **If both packs are inoperative:**

PACK 1..........OFF
PACK 2..........OFF
RAM AIR..........ON

Note: *If the "AVIONICS SMOKE" procedure has to be applied, the following flight time limitations have to be considered to protect the avionic equipment:*
At ISA +40: 0.5 h
At ISA +30 : 1.5 h
At ISA +20: 4 h
At ISA +10 and below: No limitation.

- **If both automatic cabin pressure control systems are inoperative, or if there is structural damage:**

DURING COCKPIT PREPARATION

FLIGHT PLAN INITIALIZATION

MAX SPEED: 250 kt
MAX CRZ FL: 100/MSA

If the altitude of the aircraft cabin reaches 14 000 ft, the cabin oxygen masks will automatically drop.

The flight crew must decide the minimum aircraft altitude, depending on:
- The MSA
- Oxygen requirements
- Turbulence, that can be uncomfortable for passengers
- Possible low OAT, that can be uncomfortable for passengers when the aircraft is ventilated by emergency ram air only.

- **If aircraft cruise FL is above FL 95:**

EXPECT CAB PR EXCESS CAB ALT ALERT

- **If both packs are inoperative:**

  PACK 1.....OFF
  PACK 2.....OFF
  RAM AIR.....ON

  Note: *If the "AVIONICS SMOKE" procedure has to be applied, the following flight time limitations have to be considered to protect the avionic equipment:*
  At ISA +40: 0.5 h
  At ISA +30 : 1.5 h
  At ISA +20: 4 h
  At ISA +10 and below: No limitation.

- **If both automatic cabin pressure control systems are inoperative, or if there is structural damage:**

  PACK 1.....ON
  PACK 2.....ON
  CABIN PRESS MODE SEL.....MAN
  MAN V/S CTL.....AS RQRD

  L2 *Use MAN V/S CTL sw to set the outflow valve opening to 50 %.*

  L1 OUTFLOW VALVE HALF OPEN.....CHECK

  L2 *The outflow valve opening is limited to 50 %, to prevent the cabin air suction effect.*

CAB PRESS SYSTEM

TAKEOFF

TAKEOFF WITH BOTH PACKS OFF : DO NOT PERFORM

L2 *Takeoff with both packs off may trigger the CAB PR EXCESS CAB ALT alert.*

L1 APU BLEED.. AS RQRD

If required for takeoff performance, takeoff must be performed with:

- Both packs running supplied by APU bleed, *Refer to LIM-APU APU Bleed*, or
- One pack running supplied by APU bleed (if permitted), *Refer to LIM-APU APU Bleed*.

IN FLIGHT OR ON GROUND

- **If the** CAB PR EXCESS CAB ALT **alert triggers:**

L2
  - During descent (when cabin altitude is above 9 550 ft ± 350 ft)
  - On ground after electrical power application (if cabin altitude is above 9 550 ft ± 350 ft).

L1 Use the CLR pb to cancel the alert.

HYD SYSTEM

- **If the** HYD Y(B)(G) RSVR LO AIR PR **alert triggers on ground:**

  Before engine start: SWITCH OFF AFFECTED HYD PUMP.

Ident.: PRO-NOR-SUP-MISC-A-A-00020650.0017001 / 05 MAY 22
Applicable to: MSN 04441-04465, 05184, 05591, 05752, 06139, 06173, 06414

TAKEOFF ON AIRPORT WITH AN ELEVATION OF 9 200 FT OR ABOVE

COCKPIT PREPARATION

HIGH ALT LDG pb-sw (for all on ground operation)..ON

BEFORE PUSHBACK OR START

ACCU PRESS.. CHECK

L2 If required, use the HYD YELLOW ELEC PUMP to recharge the brake accumulator.

L1 GEN 1.. OFF
GEN 2.. OFF

G ENG PUMP..OFF
Y ENG PUMP..OFF

ENGINE START

- **When idle is reached:**

GEN 1..ON
GEN 2..ON
G ENG PUMP..ON
Y ENG PUMP..ON

TAKEOFF

Note: For A/C operating under FAA requirements, as long as the cabin altitude is above 12 000 ft in flight, at least one flight crewmember must use the oxygen mask continuously.

TAKEOFF WITH BOTH PACKS OFF : DO NOT PERFORM

L2 *Takeoff with both packs off may trigger the CAB PR EXCESS CAB ALT alert.*

L1 APU BLEED..AS RQRD

If required for takeoff performance, takeoff must be performed with:

- Both packs running supplied by APU bleed up to 17 000 ft, or
- One pack running supplied by APU bleed, *Refer to LIM-APU APU Bleed*.

CRUISE

LDG ELEV AUTO [CRUISE page]..CHECK

- **When cabin altitude below 12 000 ft and decreasing:**

HIGH ALT LDG pb-sw ....OFF

CHECK THAT CABIN ALTITUDE DECREASES BELOW 9 550 ft ± 350 ft

L2 This will allow the CAB PR EXCESS CAB ALT alert to trigger again if necessary despite the clear action.

L1 LANDING ON AIRPORTS WITH AN ELEVATION OF 9 200 FT OR ABOVE

CRUISE

- **If CAB ALT exceeds 8 000 ft:**

LDG ELEV: 8 000 ft ....SET

L2 Manually selecting a landing field elevation overrides the FMGS landing field elevation for the remaining time of cruise.

L1

Note: *A step descent or turbulence conditions may trigger an early CPC descent mode detection, leading the CPC to start controlling to the landing field elevation pressure.*

DESCENT PREPARATION

Note: *For A/C operating under FAA requirements, at least one flight crewmember must use the oxygen mask continuously until landing.*

HIGH ALT LDG pb-sw .... ON

L2

Passengers oxygen masks would drop when cabin altitude is above 14 000 ft +250 ft/-750 ft if HIGH ALT LDG pb-sw is OFF.

L1

Note: *Passengers oxygen masks drop above 16 000 ft +250 ft/-750 ft cabin altitude if HIGH ALT LDG pb-sw is ON.*

LDG ELEV.................... AUTO

L2

CPC starts controlling the pressure to the landing field elevation at beginning of descent.

L1

DESCENT

- **After descent initiation or following a level off when cabin altitude has reached 8 500 ft:**
  MODE SEL pb .... MAN
  - **After 10 s**
    MODE SEL pb .... AUTO

Note: *CPC changeover after descent initiation will force the CPC in standby mode to become operational in cruise mode. This will limit the cabin altitude to 8 000 ft. When descent is detected, the cabin altitude will then increase from 8 000 ft to the targeted airfield elevation.*

AFTER LANDING

HIGH ALT LDG pb-sw (for all on ground operation).................... ON

Operations at QNH above 1050 hPa (31.00 inHg)

GENERAL

Ident.: PRO-NOR-SUP-MISC-C-00024567.0002001 / 10 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

Operators may occasionally experience high barometric settings above 1 050 hPa (31.00 inHg), due to polar anticyclonic air mass conditions. These conditions mainly occur during winter in the upper northern region.
For departure and arrival, the flight crew must ensure that the aircraft remains within its flight envelope.

CAUTION	When the QNH exceeds 1 050 hPa (31.00 inHg), the aircraft pressure altitude might be outside of its flight envelope (below -1 000 ft STD), depending on the airfield elevation. Operations at QNH above 1 050 hPa (31.00 inHg) are only authorized within the flight envelope of the aircraft.

In addition, the flight crew should apply the following procedures when the QNH is more than 1 050 hPa (31.00 inHg).

GENERAL

Ident.: PRO-NOR-SUP-MISC-C-00024567.0003001 / 10 MAY 21
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-09324, 10949-11139

Operators may occasionally experience high barometric settings above 1 050 hPa (31.00 inHg), due to polar anticyclonic air mass conditions. These conditions mainly occur during winter in the upper northern region.
High QNH values may result in pressure altitudes below -1 000 ft during takeoff and landing at low altitude airports. Therefore, the flight crew should apply the following procedures when the QNH is more than 1 050 hPa (31.00 inHg).

PROCEDURES

Ident.: PRO-NOR-SUP-MISC-C-P-00024599.0002001 / 10 MAY 21

BEFORE TAKEOFF

Note: The Standby Altitude Correction Table provides the baro setting that should be used on the standby altimeter. See Standby Altitude Correction Table, Refer to PRO-NOR-SUP-MISC-C Standby Altitude Correction.

[STBY ALTIMETER] BARO SETTING.. SET
USE THE CORRECTION VALUE FOR ALTITUDE READINGS

L2 *To obtain the correct altitude flown by the aircraft, add the correction value to the standby altimeter indication. See Standby Altitude Correction Table, Refer to PRO-NOR-SUP-MISC-C Standby Altitude Correction.*

Ident.: PRO-NOR-SUP-MISC-C-P-00024600.0001001 / 10 MAY 21
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-09324, 10949-11139

TAKEOFF

- **Above 1 000 ft, when time permits:**
  ALT RPTG..ON
  L2 *As a result, the TCAS automatically reverts to its previous setting.*

Ident.: PRO-NOR-SUP-MISC-C-P-00024607.0001001 / 26 OCT 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

DESCENT PREPARATION

DO NOT INSERT a DEST QNH value on the MCDU PERF APPR page.

Note: *As no DEST QNH is entered, the FMS initially assumes that standard barometric reference will be kept down to destination for descent flight path calculations. When QNH is set on the FCU, the aircraft and cabin altitude will be higher than expected (the aircraft altitude can be up to 2 000 ft higher than expected). This will lead to a higher descent rate, with a possible CAB PR LO DIFF PR alert, and possible opening of the cabin pressure safety valve.*

- **For QFE use:**

  LDG ELEV ....SET TO 0

L2 *When Approach phase is activated, a TERR STBY memo appears on the E/WD.*

Ident.: PRO-NOR-SUP-MISC-C-P-00024601.0001001 / 10 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321

DESCENT

- **When approaching transition level:**

  Note: *The Standby Altitude Correction Table provides the baro setting that should be used on the standby altimeter. See Standby Altitude Correction Table, Refer to PRO-NOR-SUP-MISC-C Standby Altitude Correction.*

  [STBY ALTIMETER] BARO SETTING....................................SET

  USE THE CORRECTION VALUE FOR ALTITUDE READINGS

Ident.: PRO-NOR-SUP-MISC-C-P-00024602.0001001 / 10 MAY 21
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-09324, 10949-11139

APPROACH

- **Before final approach:**

  ATC..NOTIFY

L2 *Notify the ATC that the altitude reporting will be turned off.*

L1 ALT RPTG..OFF

L2 *Due to the transponder limitation, the flight crew must disconnect the altitude reporting. After the flight crew turn off the altitude reporting, a TCAS STBY memo appears on the E/WD.*

L1 Note: *Perform approaches based on a barometric vertical profile using selected lateral and vertical guidance, and raw data reference.*

STANDBY ALTITUDE CORRECTION

Ident.: PRO-NOR-SUP-MISC-C-00024744.0001001 / 10 MAY 21

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321

The Standby Altitude Correction Table below provides the baro setting that should be used on the standby altimeter, and the correction that should be applied to the altimeter indications, for each QNH between 1 050 hPa and 1 089 hPa.

Barometric Reference (hPa)	Stby Altimeter Baro Setting (hPa)	Correction (feet)
1 050	1 050	0
1 051	1 047	100
1 052	1 048	100
1 053	1 049	100
1 054	1 046	200
1 055	1 047	200

Barometric Reference (hPa)	Stby Altimeter Baro Setting (hPa)	Correction (feet)
1 082	1 047	900
1 083	1 048	900
1 084	1 049	900
1 085	1 047	1 000
1 086	1 048	1 000
1 087	1 049	1 000
1 088	1 050	1 000
1 089	1 047	1 100

Standby Altitude Correction Table

HOW TO USE

Set the baro reference of the standby altimeter to the appropriate value.

Then:
- To obtain the correct altitude, add the correction to the altimeter indication
- To fly at a desired altitude, subtract the correction from the desired altitude.

EXAMPLE

If the QNH of the day is 1 072 hPa, the baro setting on the standby altimeter should be 1 049 hPa. When reading an altitude on the standby altimeter, it is necessary to add 600 ft to obtain the actual altitude of the aircraft.
Therefore, in this example, the indicated altitude on the standby altimeter should be 1 400 ft, in order to fly at 2 000 ft QNH.

Intentionally left blank

Pushback with Power Push Unit

PUSHBACK WITH POWER PUSH UNIT VIA THE MAIN LANDING GEAR

Ident.: PRO-NOR-SUP-MISC-D-A-00020472.0002001 / 26 OCT 22
Applicable to: MSN 01376-01459, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11139

When pushback is performed with a Power Push Unit (PPU) via the main landing gear, this procedure replaces the BEFORE PUSHBACK OR START SOP.

- **Before start clearance**

SOP - BEFORE START CLEARANCE...PERFORM

L2 *Refer to PRO-NOR-SOP-07 Before Start Clearance.*

L1 NW STRG DISC MEMO...CHECK NOT DISPLAYED

L2 *The ground crew should check that the towing lever is in the normal position.*

L1
- **At start clearance**

PUSHBACK/START CLEARANCE...OBTAIN

L2 *Obtain ATC pushback/start clearance.*
Obtain ground crew clearance.

L1 ATC...SET FOR OPERATION

L2 *ATC is set in accordance with airport requirements.*

L1 WINDOWS AND DOORS...CHECK CLOSED

L2 *- To ensure that the sliding window is correctly closed, push the handle of the sliding window fully forward to the closed position, and check that the red indicator is visible.*
- Check, on the ECAM lower display, that all the aircraft doors are closed.
- When required by local airworthiness authorities, check that the cockpit door is closed and locked (no cockpit door open/fault indication).
If entry is requested, identify the person requesting entry before unlocking the door. With the cockpit door sw on NORM, the cockpit door is closed and locked. If entry is requested from the cabin, and if no further action is performed by the pilot, the cabin crew will be able to unlock the door by using the emergency access procedure. Except for crew entry/exit, the cockpit door should remain closed until engine shutdown.

L1 SLIDES...CHECK ARMED

L2 *- Check, on the ECAM lower display, that all slides are armed.*

L1 BEACON sw...ON

THRUST LEVERS...IDLE

CAUTION	*Engines will start, regardless of the thrust lever position; thrust will rapidly increase to the corresponding thrust lever position, causing a hazardous situation, if thrust levers are not at IDLE.*

ACCU PRESS indicator...CHECK

L2 *The ACCU PRESS indication must be in the green band. If required, use the electric pump on yellow hydraulic system to recharge the brake accumulator.*

L1 PARK BRK handle...CHECK ON

BRAKES PRESS indicator...CHECK

L2 *Check for normal indication.*

L1 BEFORE START CHECKLIST ....COMPLETE

Ident.: PRO-NOR-SUP-MISC-D-A-00020472.0001001 / 26 OCT 22

Applicable to: MSN 01143-01251, 01518, 01593-01628

When pushback is performed with a Power Push Unit (PPU) via the main landing gear, this procedure replaces the BEFORE PUSHBACK OR START SOP.

- **Before start clearance**

SOP - BEFORE START CLEARANCE...PERFORM

L2 *Refer to PRO-NOR-SOP-07 Before Start Clearance.*

L1 NW STRG DISC MEMO...CHECK NOT DISPLAYED

L2 *The ground crew should check that the towing lever is in the normal position.*

L1
- **At start clearance**

PUSHBACK/START CLEARANCE...OBTAIN

L2 *Obtain ATC pushback/start clearance.*
Obtain ground crew clearance.

L1 ATC...SET FOR OPERATION

L2 *ATC is set in accordance with airport requirements.*

L1 WINDOWS AND DOORS...CHECK CLOSED

L2 *- To ensure that the sliding window is correctly closed and locked, push the handle of the sliding window fully forward to the closed position, and verify that the red indicator is visible.*
- Check, on the ECAM lower display, that all the aircraft doors are closed.

L1 SLIDES...CHECK ARMED

L2 *- Check, on the ECAM lower display, that all slides are armed.*

L1 BEACON sw...ON

THRUST LEVERS.....IDLE

CAUTION	*Engines will start, regardless of the thrust lever position; thrust will rapidly increase to the corresponding thrust lever position, causing a hazardous situation, if thrust levers are not at IDLE.*

ACCU PRESS indicator.....CHECK

L2 *The ACCU PRESS indication must be in the green band. If required, use the electric pump on yellow hydraulic system to recharge the brake accumulator.*

L1 PARK BRK handle.....CHECK ON

BRAKES PRESS indicator.....CHECK

L2 *Check for normal indication.*

L1 BEFORE START CHECKLIST .....COMPLETE

Ident.: PRO-NOR-SUP-MISC-D-A-00020473.0002001 / 17 MAR 17
Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11139

ENG 2.....START

L2 *Engine 2 is usually started first to pressurize the yellow hydraulic system, making the nosewheel steering and parking brake available.*

Ident.: PRO-NOR-SUP-MISC-D-A-00020473.0001001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

ENG 2.....START

L2 *Engine 2 is usually started first to pressurize the yellow hydraulic system, making the parking brake available.*

L1 PTU.....CHECK AUTO

L2 *The green hydraulic system is pressurized via PTU, making the nosewheel steering available.*

Ident.: PRO-NOR-SUP-MISC-D-A-00020474.0001001 / 17 MAR 17
Applicable to: ALL

PUSHBACK

Due to a face-to-face situation between the ground personnel and the flight crew, a clear understanding of directional phraseology is essential.

PARK BRK handle.....OFF

BRAKES PRESS indicator.....CHECK ZERO

L2 *A slight residual pressure may remain for a short period of time on the triple indicator. Advise the ground crew that the parking brake is off and that the pushback can be started.*

L1

CAUTION	*Do not use the brakes during pushback, except in case of emergency.* *Do not move flight controls or flap lever.*

L2 *In case of emergency, order the ground crew to separate the PPU and move it away from the evacuation areas. Nevertheless, evacuation is possible with the PPU in place.*

L1 STEERING HANDWHEEL..AS REQUIRED

L2 *Steer the aircraft using guidance from the ground crew.*

L1

- **When pushback is completed:**
  PARK BRK handle..ON
  BRAKES PRESS indicator..CHECK
  GROUND CREW..ADVISED TO REMOVE PPU

- **When PPU is removed and ground crew clearance obtained:**
  ENG 1..START
  SOP - AFTER START..RESUME
  Refer to PRO-NOR-SOP-09 After Start

AUTOMATIC DEPENDENT SURVEILLANCE - BROADCAST (ADS-B)

Ident.: PRO-NOR-SUP-SURV-00020957.0001001 / 17 MAR 17
Applicable to: MSN 02321, 02734, 02924-03002, 03058, 03180-03211, 03266, 04827-04860, 08495-09324, 10949-11139

ADS-B OUT:

In some cases, the ATC ground stations can receive non valid data from the ADS-B function.
Therefore, the air traffic controller may ask the flight crew to stop the transmission of the ADS-B data (e.g. the air traffic controller requests "STOP ADS-B TRANSMISSION" or "STOP ADS-B ALTITUDE TRANSMISSION").
The flight crew cannot switch off the ADS-B automatic data transmission independently of the XPDR.
Therefore, do not switch off the ATC transponder or the altitude reporting, in order to maintain TCAS operations or Air Traffic Controller radar surveillance.
In such cases, the flight crew must refer to local Aeronautical Information Publication (AIP) to apply alternate procedure when the air traffic controller requests to stop ADS-B transmission.

ADS-B IN:

The ATSAW ◁ enables the reception of ADS-B information from other aircraft in the vicinity.
Refer to the ATSAW section.

ENHANCED GROUND PROXIMITY WARNING SYSTEM (EGPWS)

Ident.: PRO-NOR-SUP-SURV-00020960.0004001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014, 02734

During climb, descent, approach and go-around phases:

- **If GPS PRIMARY ◁ is not available and FMS navigation accuracy check prevents the flight crew from using NAV mode in a phase of flight:**
  TERR pb-sw..OFF

  Note: *When the TERR pb-sw is switched OFF, the ECAM message “NAV GPWS TERR DET FAULT” is displayed.*
  Only the basic GPWS modes 1 to 5 remain operative.

Intentionally left blank

 +0.0/+0.0     STATUS/XLOAD>
```

CAUTION	*Cycling the navigation database deletes the active and secondary flight plans. Do not cycle it while airborne because doing so will delete the flight plan, eliminate all speed predictions, and blank the ND. If the aircraft is in managed speed, Green Dot becomes the speed target.*

CHECKING STORED WAYPOINTS, NAVAIDS, RUNWAYS, OR ROUTES

PRESS the DATA key.
PRESS the next page key [→].

SELECT, successively, as required:
- STORED WAYPOINT
- STORED NAVAIDS
- STORED RUNWAYS
- STORED ROUTES

CHECK the contents of each of these data storages and DELETE items, as appropriate.

NAVAIDS DESELECTION

The flight crew can manually deselect all the RADIO NAVAIDs as follows:

PRESS the DATA key
SELECT the POSITION MONITOR page
SELECT the SELECTED NAVAIDS page
PRESS [5L] to DESELECT all the RADIO NAVAIDs

If NOTAMS indicate that selected NAVAIDs are unreliable or unserviceable, deselect them as follows:

PRESS the DATA key.
SELECT the POSITION MONITOR page.
SELECT the SELECTED NAVAIDS page.
Under “DESELECT”, INSERT the NAVAID identifier in the brackets.

The flight crew can only make six deselections.

ROUTE SELECTION

If waypoints, NAVAIDs or airports are not in the NAV database, the crew must define and store them manually, using the "data stored" function.

Ident.: PRO-NOR-SRP-01-10-A-00003962.0037001 / 23 JUN 15
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734, 02896-02904

ALIGNING IRS

PRESS the INIT key, and then the IRS INIT prompt.

IRS INIT page is displayed with the airport reference point as default coordinates.

If necessary, PRESS [1L] and/or [1R] and use scroll keys to adjust the latitude and/or longitude values.

For example, this can be used to enter the gate precise coordinates when the aircraft is intended to fly without GPS on long segments without radio coverage.

PRESS the ALIGN ON REF prompt and CONFIRM ALIGN* prompt.

The displayed coordinates are sent to ADIRS for initialization.
The alignment status changes to ALIGNING ON REF.

- **If the “CHECK IRS/AIRPORT POS” or "REF/GPS POS DIF" or "REF/LAST IRS POS DIF" message is displayed:**

  CHECK the departure airport on INIT A page and CORRECT it if necessary.

  REALIGN the IRS per the procedure described previously.

- **If a new FROM or a new CO RTE is entered after IRS alignment is already completed, the ALIGN ON REF prompt is displayed in [6R]:**

  REALIGN the IRS per the procedure described previously.

Ident.: PRO-NOR-SRP-01-10-A-00003962.0046001 / 23 JUN 15

3 **Applicable to: MSN 02887, 02924-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

ALIGNING IRS

The alignment phase is completed, when the ADIRS is initialized to an appropriate position. If the GPS is available, initialization is automatic, using the GPS position. Flight crew intervention is not necessary.
However, automatic initialization may be manually overriden by flight crew entry, at any moment during the alignment phase. In this case, perform the following procedure as soon as possible, to prevent delays if an alignment error occurs:

PRESS the INIT key, and then the IRS INIT prompt.

IRS INIT page is displayed with the airport reference point as default coordinates.

If necessary, PRESS [1L] and/or [1R] and use scroll keys to adjust the latitude and/or longitude values.

For example, this can be used to enter the gate precise coordinates when the aircraft is intended to fly without GPS on long segments without radio coverage.

PRESS the ALIGN ON REF prompt and CONFIRM ALIGN* prompt.

The displayed coordinates are sent to ADIRS for initialization.
The alignment status changes to ALIGNING ON REF.

- **If the “CHECK IRS/AIRPORT POS” or "REF/GPS POS DIF" or "REF/LAST IRS POS DIF" message is displayed:**

  CHECK the departure airport on INIT A page and CORRECT it if necessary.

  REALIGN the IRS per the procedure described previously.

- **If a new FROM or a new CO RTE is entered after IRS alignment is already completed, the ALIGN ON REF prompt is displayed in [6R]:**

  REALIGN the IRS per the procedure described previously.

PRESS the F-PLN key on the MCDU.
SELECT VERTICAL REVISION at the FROM waypoint.
WRITE a new speed limit/altitude and ENTER.

The crew can insert one climb speed limit and one descent speed limit into the vertical flight plan, or modify or clear the limits that are already in it.
The speed limit is defined by a speed and an altitude (for example, 230/9 000), which means that the managed speed target will be limited by the speed limit when the aircraft flies below the specified altitude.

In both climb and descent, 250 kt at 10 000 ft is the default speed limit in the vertical flight plan. The vertical revision page presents the climb speed (CLB SPD) limit if the revised waypoint is between departure and top of descent.
The vertical revision page shows the descent speed (DES SPD) limit, if the revised waypoint is between top of descent and destination.
It can be deleted by a clear action, the field reverts to brackets. It can also be cleared directly on the F-PLN A page by clearing the SPD LIM pseudo-waypoint.

MAGENTA

Procedure

PRESS the F-PLN key on the MCDU.
SELECT the VERT REV page at the revised waypoint.
WRITE the speed constraint value into the scratchpad and ENTER it in 3L.
INSERT the constraint using the appropriate *CLB or DES* prompt when displayed. If CLB and DES are not displayed, insertion occurs when the value is entered in 3L.

The system displays the climb (CLB) or the descent (DES) prompt at [6L] or [6R] when the predictions are not yet available or when the waypoint is part of the cruise phase as originally defined.
When predictions are not yet available, the constraints are displayed on the F-PLN A page in magenta.

When predictions are available, the speed constraint is highlighted by a star (*).
** If the predicted speed matches the constraint, the star is magenta.*
** If the prediction is that the aircraft will miss the speed constraint, the star is amber.*
If a speed constraint cannot be met (by more than 10 kt), the FMGS generates the message “SPD ERROR AT WPT XX”.

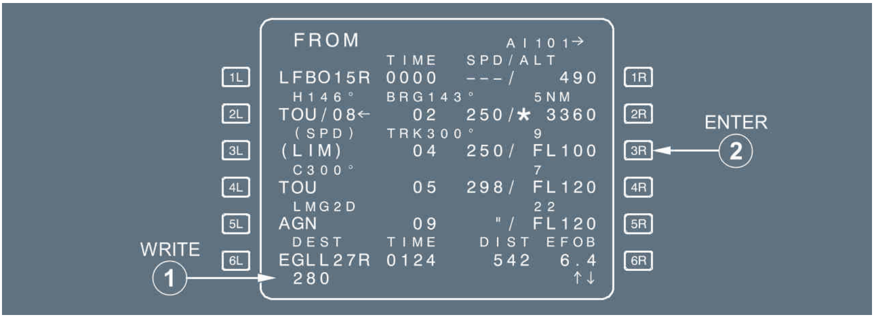
A speed constraint may be assigned to any waypoint in the climb or the descent phase except the FROM, origin, or destination waypoints, and any pseudo waypoint.

When a speed constraint is assigned to a waypoint, the constraint will limit the managed speed target as follows:
- *In takeoff or climb phase until you pass the constrained waypoint.*
- *In descent an approach phase, after passing the constrained waypoint.*

Speed constraints are observed by the FMGS when NAV mode and speed managed are active.

ENTERING A SPEED CONSTRAINT THROUGH F-PLN A PAGE

You may also enter a speed constraint through the F-PLN A page.



```

                          ↑↓
```

Procedure

PRESS the F-PLN key on the MCDU.

SELECT the “VERT REV” page at the revised waypoint.
WRITE an altitude constraint in the scratchpad and ENTER it in 3R.
INSERT the constraint using *CLB or DES* prompt when it is displayed. Otherwise the value is inserted when it is entered in 3R field.

*The system displays the *CLB or DES* prompt, when the predictions are not yet available, or when the waypoint is part of the cruise phase as originally defined.*

Note: *In case of QFE operations, the altitude constraints must be converted and entered as an altitude in feet.*

You or the database may assign an altitude constraint to any waypoint in the climb or descent phases except the FROM, origin, or destination waypoints, or any pseudo waypoint.
An altitude constraint may be defined as an “at”, an “at or above”, or an “at or below” constraint. In certain procedures, the database may define an altitude constraint as a window in which the aircraft should fly.

Enter “AT” constraints with no sign.
Enter “AT or ABOVE” constraints preceded by a + sign (+FL 130, for example).
Enter “AT or BELOW” constraints preceded by a – sign (-15 000, for example).
enter four or five-digit number when entering altitude. Include the lead zero (0 500 ft , for example).

For flight level, enter a two- or three-digit number, with or without the letters “FL”. The lead zero is optional. (Examples : +FL 120 or +120 ; -FL 090 or -90 or -090)

Enter the altitude value as either altitude or flight level ; the MCDU displays the selected value as an “ALT” or “FL,” as appropriate for the transition altitude.

The constraint must be higher than the thrust reduction altitude and lower than the cruise flight level.
Once inserted in the flight plan, the altitude constraint (ALT CSTR) is displayed in magenta as long as predictions are not available.
When predictions are available, the altitude constraints are replaced by the predicted altitude at relevant waypoints highlighted by a star.
** If the predicted altitude matches the constraint the star is magenta. If the predicted altitude is missed (by more than 250 ft), the star is amber.*

ND Display

An altitude-constrained waypoint is marked by a circle (◯) on the navigation display.

This circle is white when the guidance does not take the altitude constraint into account. It is magenta if the guidance system takes the altitude constraint into account and predicts that it will be matched.
It is amber if the guidance system takes the altitude constraint into account and predicts that it will not be matched.

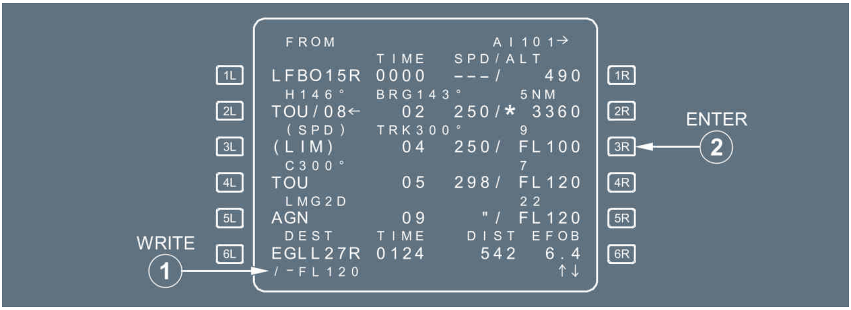
The aircraft should be at or below FL 120 at AGN and above FL 180 at LACOU.

Entering an Altitude Constraint Through F-PLN A Page

The pilot may also enter an altitude constraint directly through the F-PLN A page.
When entering the value into the scratchpad do not forget the slash e.g. /-120 or /-FL 120.
If the slash is omitted the value will be considered as a speed constraint if it is within the range value.



```
 FROM                   AI101→
          TIME   SPD/ALT
LFBO15R   0000   ---/     490

```

Use CLR to delete them directly from the flight plan page, as well. However, if there is also a speed constraint assigned at that waypoint, the clear action deletes it too.

ENTERING AN ESTIMATED TIME OF TAKEOFF (ETT)

In Preflight Phase:

SELECT the SEC F-PLN key on the MCDU.
SELECT a VERT REV at any waypoint.
SELECT the Required Time of Arrival (RTA) prompt (2R).

The MCDU displays the RTA page.

ENTER the Estimated Takeoff Time in the [6R] field.

The format is HHMMSS (entry of seconds is not mandatory).

ENTER it in the 6R field

If the aircraft has not taken off by the time entered as estimated takeoff time, the MCDU displays the “CLK IS TAKE OFF TIME” message, meaning that the system will replace your estimated takeoff time with the actual time.

When beginning the takeoff roll, the system automatically adopts that clock time as the takeoff time.

If the origin airport is changed, or the clock time is invalid, the system automatically deletes the estimated takeoff time.

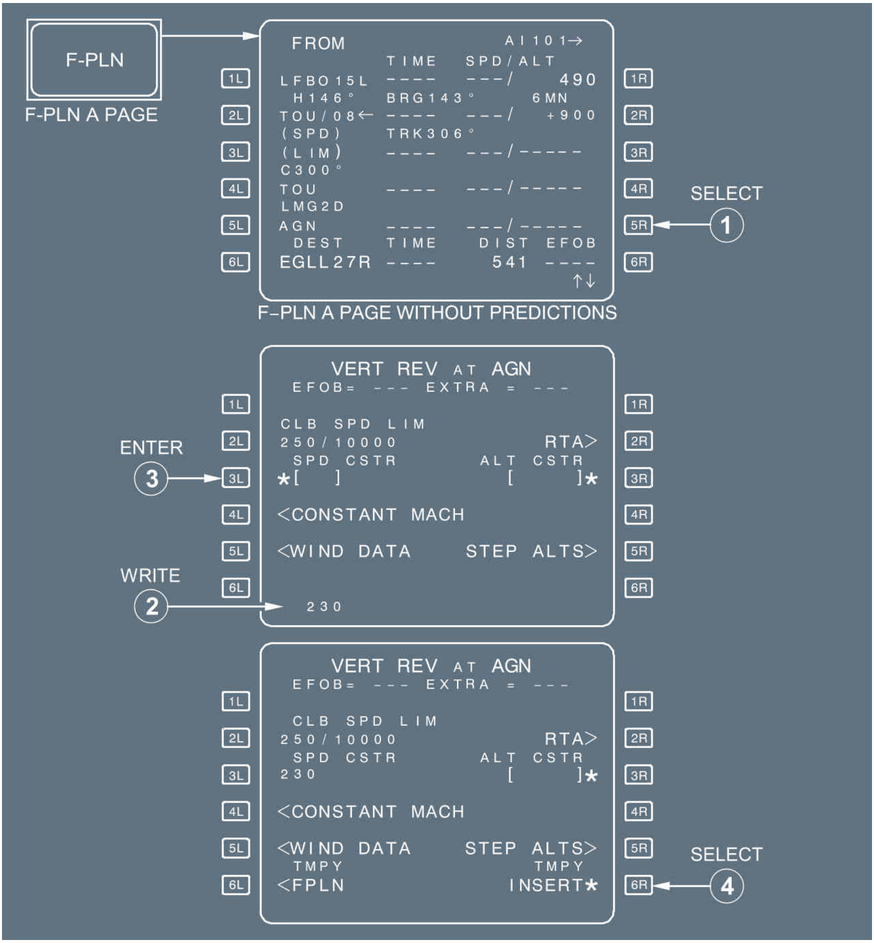
The crew can insert one climb speed limit and one descent speed limit into the vertical flight plan, or modify or clear the limits that are already in it.
The speed limit is defined by a speed and an altitude (for example, 230/9 000), which means that the managed speed target will be limited by the speed limit when the aircraft flies below the specified altitude.

In both climb and descent, 250 kt at 10 000 ft is the default speed limit in the vertical flight plan.
The vertical revision page presents the climb speed (CLB SPD) limit if the revised waypoint is between departure and top of descent.
The vertical revision page shows the descent speed (DES SPD) limit, if the revised waypoint is between top of descent and destination.
It can be deleted by a clear action, the field reverts to brackets. It can also be cleared directly on the F-PLN A page by clearing the SPD LIM pseudo-waypoint.

CHECK and INSERT the TMPY F-PLN or continue with next revision.

Note: *The speed limit cannot be cleared in the temporary flight plan. If the crew inadvertly tries to clear the SPD LIM in the TMPY F-PLN, the message “NOT ALLOWED” is displayed in the scratchpad.*

ENTERING A SPEED CONSTRAINT



```

 TMPY                    TMPY
<FPLN                 INSERT*
```

Procedure

PRESS the F-PLN key on the MCDU.
SELECT the VERT REV page at the revised waypoint.
WRITE the speed constraint value into the scratchpad and ENTER it in 3L.
CHECK and INSERT the TMPY F-PLN or continue with next revision.

Note: *A speed constraint can also be entered directly on F-PLN page, without using VERT REV page.*

When predictions are not yet available, the constraints are displayed on the F-PLN A page in magenta.

When predictions are available, the speed constraint is highlighted by a star (*).
** If the predicted speed matches the constraint, the star is magenta.*
** If the prediction is that the aircraft will miss the speed constraint, the star is amber.*
If a speed constraint cannot be met (by more than 10 kt), the FMGS generates the message “SPD ERROR AT WPT XX”.

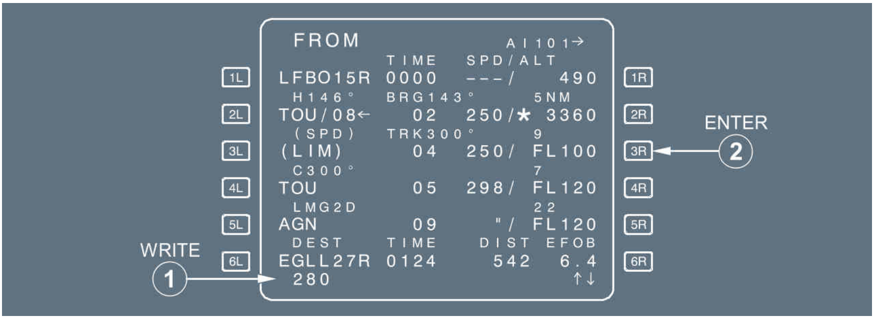
A speed constraint may be assigned to any waypoint in the climb or the descent phase except the FROM, origin, or destination waypoints, and any pseudo waypoint.

When a speed constraint is assigned to a waypoint, the constraint will limit the managed speed target as follows:
- *In takeoff or climb phase until you pass the constrained waypoint.*
- *In descent an approach phase, after passing the constrained waypoint.*

Speed constraints are observed by the FMGS when NAV mode and speed managed are active.

ENTERING A SPEED CONSTRAINT THROUGH F-PLN A PAGE

You may also enter a speed constraint through the F-PLN A page.



```
 FROM                       AI101→

 TMPY                     TMPY
<ERASE                 INSERT*
```

Procedure

PRESS the F-PLN key on the MCDU.
SELECT the “VERT REV” page at the revised waypoint.
WRITE an altitude constraint in the scratchpad and ENTER it in 3R.
If ← CLB and DES → prompt are displayed, SELECT the type of constraint.

The system displays the ← CLB or DES → prompt, when the predictions are not yet available, or when the waypoint is part of the cruise phase as originally defined.

CHECK and INSERT the TMPY F-PLN or continue with next revision

Note: 1. *In case of QFE operations, the altitude constraints defined in heights (QFE) must be converted and entered in the FMS as altitudes (QNH).*
2. *An altitude constraint can also be entered directly on F-PLN page, without using VERT REV page.*

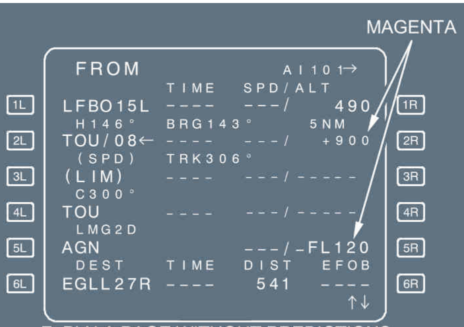
You or the database may assign an altitude constraint to any waypoint in the climb or descent phases except the FROM, origin, or destination waypoints, or any pseudo waypoint.
An altitude constraint may be defined as an “at”, an “at or above”, or an “at or below” constraint. In certain procedures, the database may define an altitude constraint as a window in which the aircraft should fly.

Enter “AT” constraints with no sign.
Enter “AT or ABOVE” constraints preceded by a + sign (+FL 130, for example).
Enter “AT or BELOW” constraints preceded by a – sign (-15 000, for example).
enter four or five-digit number when entering altitude. Include the lead zero (0 500 ft , for example).

For flight level, enter a two- or three-digit number, with or without the letters “FL”. The lead zero is optional. (Examples : +FL 120 or +120 ; -FL 090 or -90 or -090)

Enter the altitude value as either altitude or flight level ; the MCDU displays the selected value as an “ALT” or “FL,” as appropriate for the transition altitude.

The constraint must be higher than the thrust reduction altitude and lower than the cruise flight level.
Once inserted in the flight plan, the altitude constraint (ALT CSTR) is displayed in magenta as long as predictions are not available.
When predictions are available, the altitude constraints are replaced by the predicted altitude at relevant waypoints highlighted by a star.
** If the predicted altitude matches the constraint the star is magenta. If the predicted altitude is missed (by more than 250 ft), the star is amber.*



```

ND Display

An altitude-constrained waypoint is marked by a circle (○) on the navigation display.

This circle is white when the guidance does not take the altitude constraint into account. It is magenta if the guidance system takes the altitude constraint into account and predicts that it will be matched.
It is amber if the guidance system takes the altitude constraint into account and predicts that it will not be matched.

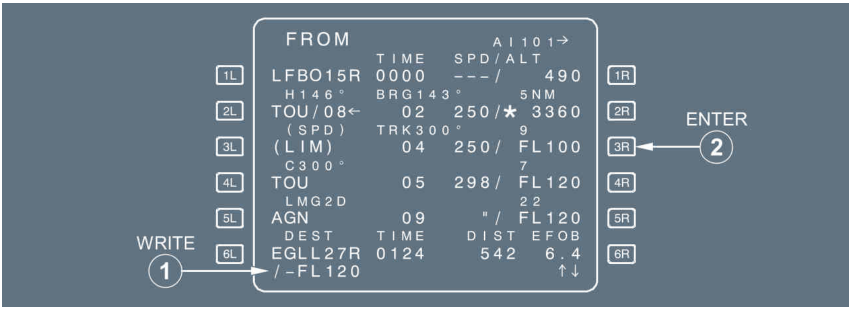
Entering an Altitude Constraint Through F-PLN A Page

The pilot may also enter an altitude constraint directly through the F-PLN A page.
When entering the value into the scratchpad do not forget the slash e.g. /-120 or /-FL 120.
If the slash is omitted the value will be considered as a speed constraint if it is within the range value.



```
 FROM                     AI101→
         TIME   SPD/ALT
LFBO15R  0000   ---/     490
  H146°  BRG143°       5NM
TOU/08←    02   250/* 3360
  (SPD)  TRK300°         9

EGLL27R  0124     542   6.4
/-FL120                  ↑↓
```

Use CLR to delete them directly from the flight plan page, as well. However, if there is also a speed constraint assigned at that waypoint, the clear action deletes it too.

ENTERING AN ESTIMATED TAKEOFF TIME (ETT)

In Preflight Phase:

SELECT the SEC F-PLN key on the MCDU.
SELECT a VERT REV at any waypoint.
SELECT the Required Time of Arrival (RTA) prompt (2R).

The MCDU displays the RTA page.

ENTER the Estimated Takeoff Time in the [5R] field.

The format is HHMMSS (entry of seconds is not mandatory).

If the aircraft has not taken off by the time entered as estimated takeoff time, the MCDU displays the “CLK IS TAKE OFF TIME” message, meaning that the system will replace your estimated takeoff time with the actual time.

When beginning the takeoff roll, the system automatically adopts that clock time as the takeoff time.

If the origin airport is changed, or the clock time is invalid, the system automatically deletes the estimated takeoff time.

EXTRA/TIME
0.0/0000

PROCEDURE

PRESS the INIT key, and the Next (“→”) key to access the INIT B page.
ENTER the ZFW and ZFWCG value in the [1R] field.
The “FUEL PLANNING →” prompt appears in the [3R] field.

Note: *As long as the final Load and Trim Sheet is not available, the crew should insert the estimated ZFW/ZFWCG in order to get fuel estimates. The ZFW and ZFWCG values must be updated with the final Load and Trim Sheet values.*

CHECK/MODIFY the TAXI [1L], RTE RSV [3L] and FINAL TIME [5L] values.
The TAXI, RTE RSV and FINAL TIME fields display the default values specified in the AMI file (for example, “0.4 t” for TAXI, “5.0 %” for RTE RSV and "0045" for FINAL TIME). The flight crew may modify these values.

Note: *At takeoff, the RTE RSV field will automatically be reset to 0. The RTE RSV fuel is then added to the EXTRA fuel, which ensures that the EXTRA fuel and MIN DEST FOB values are consistent in flight.*

ENTER an ALTN fuel value in the [4L] field, as necessary.

The flight crew may enter the ALTN fuel value planned on the Computerized Flight Plan (CFP), as necessary.

ENTER a MIN DEST FOB value in the [6L] field, as necessary.

Note: *MIN DEST FOB (equal to ALTN + FINAL) can be increased at flight crew discretion (e.g. when HOLD is expected at destination).*

ENTER the TRIP WIND value in the [5R] field, as necessary.

If no wind profile has been entered in the F-PLN, the crew may enter an average TRIP WIND in this field, to obtain more realistic fuel/time predictions before departure.

Note:

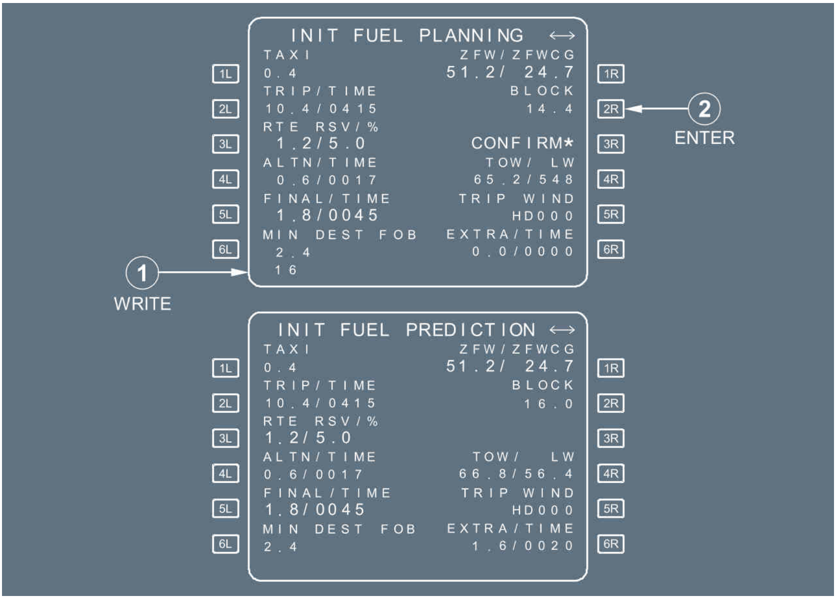
1. *The flight crew should only enter a TRIP WIND to obtain realistic fuel/time predictions, on ground. Then, the flight crew should enter a wind profile using the WIND pages, for fuel/time predictions in flight. As soon as flight crew has entered a wind profile on the WIND pages, the TRIP WIND will be erased.*
2. *If the crew has already defined a wind profile, even partially (such as climb wind), it is not possible to enter a TRIP WIND.*

ENTER the planned BLOCK fuel, as indicated in the computerized flight plan (CFP)

If the planned BLOCK fuel is not available, the crew may obtain a prediction of the minimum BLOCK fuel required for the flight by pressing the FUEL PLANNING prompt [3R].
Pressing this prompt makes the FMS compute the minimum required BLOCK fuel, which is the BLOCK fuel required to have EXTRA fuel = 0, based on the parameters entered on the INIT and F-PLN pages.
The computed BLOCK fuel value is displayed in the [2R] field, and a BLOCK CONFIRM prompt appears in the [3R] field.

Note: *In order to obtain a realistic fuel computation, the flight crew should ensure that the F-PLN initialization has been completed (including insertion of the ALTN F-PLN and/or ALTN fuel and/or MIN DEST FOB if necessary), and that flight parameters, such as CRZ FL, steps climbs (if any), and winds, have been inserted.*

- **When the final Load and Trim Sheet (LTS) data are available:**



```

ENTER the final ZFW/ZFWCG [1R], and the required BLOCK fuel [2R].

The FMS computes the predictions, based on the entered BLOCK fuel, and estimates the EXTRA fuel value.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

PRINT the PREFLIGHT REPORT, if necessary.

When the final Load and Trim Sheet values (ZFW/ZFWCG/BLOCK) have been entered, the crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

Ident.: PRO-NOR-SRP-01-10-B-00003969.0010001 / 15 FEB 11
Applicable to: ALL

TAKEOFF WITH NO WEIGHT/CG DATA

If the crew does not enter ZFW/ZFWCG data prior takeoff, or if the FMGC looses these values due to a power interruption, the following will occur:

- At takeoff, the Speed Reference System (SRS) mode is available (provided a V2 has been inserted)
- When the aircraft leaves the SRS mode, the target speed becomes the current speed and reverts to selected.

Note: *If the AP/FD has reverted to ALT or V/S (FPA) mode, the associated A/THR mode is SPEED. In this case, the system will probably reduce thrust, because the speed will be equal to, or greater than, the target speed.*

● **When appropriate, to regain FMS predictions and associated managed modes:**

INSERT the ZFW/ZFWCG values on the FUEL PRED page.

Ident.: PRO-NOR-SRP-01-10-B-00003970.0007001 / 15 FEB 11
Applicable to: ALL

INSERTING WEIGHT/CG DATA AFTER ENGINE START

The flight crew must enter the ZFW/ZFWCG values on INIT B page prior to engine start. If these data have not been entered at engine start, the MCDU displays the “INITIALIZE WEIGHTS” amber message in the scratchpad. After engine start, the crew should enter the ZFW/ZFWCG values on the FUEL PRED page.

PRESS to the FUEL PRED key.
INSERT the ZFW/ZFWCG values in the [4R] field.

This allows predictions and performance computation.

CHECK the resulting computed data, against the data planned on the CFP: TRIP fuel, RTE RSV fuel, ALTN fuel, FINAL and EXTRA fuel values.

If necessary, the flight crew may modify the ALTN or FINAL fuel values.

PRINT the PREFLIGHT REPORT, if necessary.

When the final load sheet values (ZFW/ZFWCG/BLOCK) have been entered, the crew may print the pre-flight report, which provides a copy of the F-PLN with the associated FMS predictions.

CLIMB SPEED PRESELECTION

If the managed speeds for the initial climb are not suitable, the pilot can preselect an appropriate climb speed on the “PERF CLB” page, as long as the climb phase is not active.

The CLB SPD preselection applies, when the:
- ATC specifies an initial climb speed.
- Initial climb speed must be lower than normal because:
  - There are to be turns greater than 120 ° in the initial climb out.
  - Obstacle clearance, or some other situation, requires a high climb angle.
  - The airfield has a risk area to be quickly cleared (birds reported, for example).

PRESELECTED CLB SPD

PROCEDURE

PRESS the PERF key on the MCDU.

The PERF TAKE OFF page is displayed.

SELECT the “NEXT PHASE” [6R] key to display the CLB page.
WRITE a climb speed and ENTER it.
To revert to managed speed, select MANAGED by pressing [3L].

When the aircraft is transitioning into the climb phase, the preselected value becomes the target speed:
- The selected speed target is active.
- The primary flight display shows the target speed in blue.
- The FCU’s speed window displays the new speed or Mach number.

ENTERING A HEADING/TRACK PRESET FUNCTION

Tfhe heading/track preset allows the pilot to preset a takeoff or go-around heading or track before commanding the aircraft to take up that heading or track (manual activation).
The flight crew can enter a heading or a track preset while the aircraft is on the ground and until takeoff.

PROCEDURE

- **Before takeoff:**

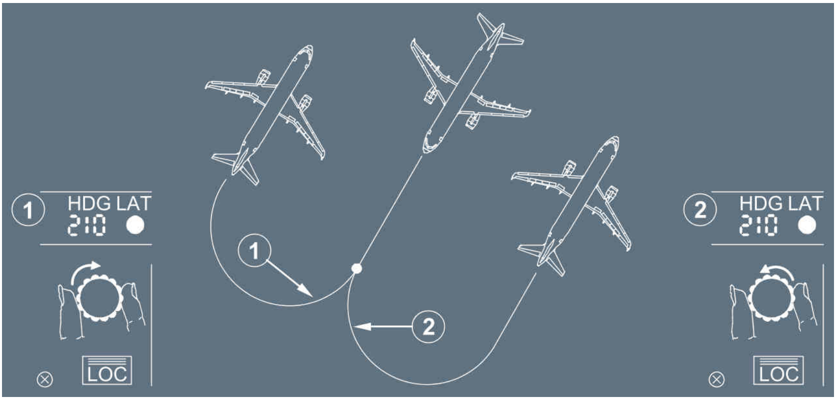
  SET the appropriate HDG or TRK in the FCU window.

  This disarms the navigation mode and allows the runway mode to remain engaged after takeoff.

- **After takeoff:**

  PULL HDG/TRK knob.

  The heading or track mode engages on the preset value.



The direction in which the pilot rotates the HDG/TRK selection knob usually determines the direction of the turn. A left rotation (decreasing heading) produces a left turn; a right rotation produces a right turn.

However, when a heading has been preset before takeoff or go-around, the direction of the turn will be such as to cause the shortest turn at the moment of engagement.

CANCELLING THE HEADING/TRACK PRESET FUNCTION

The pilot can cancel the heading preset by pushing the HDG/TRK knob back in again. This engages or arms the NAV mode.

FMGS RE-INITIALIZATION AFTER A CANCELED FLIGHT

Ident.: PRO-NOR-SRP-01-10-00013064.0001001 / 16 NOV 11
Applicable to: ALL

If the flight crew initially prepared a flight with all the data associated with this flight (takeoff speeds, winds, etc.), and if this flight is later canceled and replaced by another flight, the flight crew may use the following procedure to initialize the FMGS again:

PREPARE the new flight data in the secondary flight plan, using SEC INIT A, SEC INIT B, and SEC PERF pages
ACTIVATE the secondary flight plan.

Note: *When the flight crew activates the secondary flight plan, the following data of the primary flight plan is lost if the secondary flight plan does not include any replacement data:*
- *Alternate data*
- *Winds and cruise TEMP at waypoints as inserted on CRZ WIND pages*
- *Departure and arrival selection (STAR, APP, RWY) and approach parameters (QNH, TEMP, WIND, TRANS ALT, VAPP, MDA/MDH, DH, LDG CONF)*
- *Altitude, speed, and time constraints*
- *Steps*
- *CMS*
- *Offsets*
- *Flaps/THS*
- *Preselected cruise and descent speeds.*

F-PLN A PAGE AFTER
TMPY F-PLN INSERTION

PRESS the F-PLN key on the MCDU.
SELECT the LAT REV at origin.
SELECT the DEPARTURE prompt [1L].
SELECT the new RWY in use.

The "CHECK TAKE-OFF DATA" message is displayed.

CHECK/SELECT the appropriate SID and TRANS.
CHECK and INSERT the TMPY F-PLN, or continue with next revision.
PRESS the PERF key to access PERF TAKEOFF page.
CHECK the V1, VR, V2 and FLEX values displayed after the amber boxes. If these values are correct, PRESS [6R] to confirm and insert them. Else, ENTER new values.
ENTER the new V1, VR, V2, FLEX TEMP or CONF, as appropriate.

The previously-entered values, adjacent to the boxes, may be re-selected by pressing the CONFIRM TO DATA on [6R].*

Note: *In case of a runway change, any previous lateral modification performed on the active DEPARTURE procedure may lead to additional waypoint stacking in the temporary F-PLN. The crew has to check and revise it, as necessary.*

TAKEOFF FROM INTERSECTION

Ident.: PRO-NOR-SRP-01-15-00003976.0001001 / 09 DEC 09
Applicable to: ALL

Use RTOW or FCOM to revise takeoff parameters :
PRESS the [PERF] key on MCDU
ENTER the takeoff shift
ENTER the new V1, VR, V2, FLX TEMP, or CONF, as appropriate

Note: *The insertion of the shift in takeoff position permits the system to make an accurate revision to its navigation data at takeoff.*

Takeoff

MONITORING THE TAKEOFF

Ident.: PRO-NOR-SRP-01-30-00003983.0007001 / 09 MAY 22
Applicable to: ALL

- **At power set (thrust levers in FLX or TOGA position):**

  CHECK that the navigation is updated to the runway threshold by verifying that the aircraft symbol is centered on the runway threshold of the ND.

  CHECK the FMA for appropriate mode selection.

  Note:
  - *RWY mode appears if an ILS is tuned to a station corresponding to the departure runway. Otherwise no lateral mode comes up until the aircraft has lifted off.*
  - *Until the aircraft is airborne, do not rely on the wind displayed on the NDs.*

- **At 30 ft:**
  - **If NAV is armed,** it engages automatically.
  - **If NAV is not armed,** RWY TRK mode engages and remains displayed until the crew selects another lateral mode.

- **At 100 ft:**

  Engage AP1 or AP2.

L2 *The FMGS has an internal delay that prevents the AP from engaging 5 s after lift-off and if the aircraft is below 100 ft.*

L1
- **At thrust reduction altitude:**

  LVR CLB flashes in the first column of the FMA.

  Procedure

  SET the thrust levers to the CL detent.

L2 *A/THR activates automatically.*

L1 CHECK that the FMA displays A/THR in the fifth column.

CHECK that the FMA displays THR CLB in the first column.

- **At acceleration altitude:**

  The vertical phase automatically switches to climb.

  CLB mode engages. The target speed jumps to initial climb speed on the PFD.

  Procedure

CHECK that the FMA displays CLB in the second column.

L2

- *SRS mode remains engaged until CLB mode is engaged, which occurs at ACCEL ALT or at any other vertical mode engagement, whichever comes first*
- *If during takeoff the FCU altitude is set below the current aircraft altitude, the system ignores the FCU altitude and the aircraft remains in SRS mode until the flight crew selects an altitude above the aircraft altitude or engages any other mode.*

PRESELECTING A HDG OR A TRK

Ident.: PRO-NOR-SRP-01-30-00003984.0001001 / 16 NOV 11
Applicable to: ALL

PROCEDURE

- **If a HDG or a TRK was preselected on the ground :**

  PULL OUT the HDG/TRK selector knob when required

  CHECK that the HDG/TRK mode is active and displayed on the FMA

  When a HDG or TRK is preset, OP CLB mode will engage at the acceleration altitude. (CLB mode is not available in HDG/TRK mode).

NORMAL TAKEOFF PROFILE

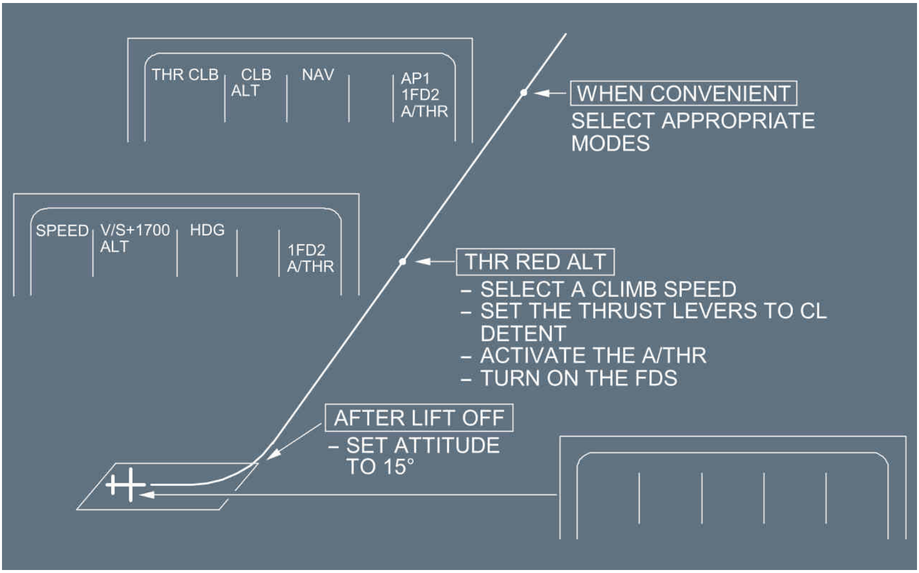
NO FLIGHT DIRECTOR TAKEOFF

Ident.: PRO-NOR-SRP-01-30-00003986.0004001 / 09 OCT 12
Applicable to: ALL

If a takeoff is initiated without FDs, the system responds as follow:
- There are no FD bars.
- There is no A/THR arming.
- There is no guidance available.
- The target speed on the PFD is that selected on the FCU or is defaulted to 100 kt.
- Setting the thrust levers to the CL detent does not activate A/THR.

Note: *Do not engage the autothrust prior to selecting a target speed on the FCU.*



THR CLB
CLB

THR RED ALT
- SELECT A CLIMB SPEED
- SET THE THRUST LEVERS TO CL
DETENT
- ACTIVATE THE A/THR
- TURN ON THE FDS
AFTER LIFT OFF
- SET ATTITUDE
TO 15°

PROCEDURE

Establish initial climb of 15 °

- **When reaching the thrust reduction altitude (THR RED ALT):**

  SELECT a climb speed.

  SET the thrust levers to CL detent.

  ACTIVATE the autothrust.

  TURN ON the FDs (basic modes engage).

  SELECT appropriate mode.

  Failure of both FDs after the start of takeoff:

  - *The FD bars disappear.*
  - *The FCU window displays the target speed, which synchronizes on V2, or the current speed (if it is higher).*
  - *The autothrust remains armed.*
  - *At thrust reduction altitude, LVR CLB flashes. If the pilot set the thrust levers to the CLB detent, the autothrust becomes active in selected SPD mode (no FDs selected).*
    If the current speed is greater than the target speed, the thrust decreases.
  - *At acceleration altitude the target speed does not change, since it is selected.*

TAKEOFF WITH NO V2 ENTRY

Ident.: PRO-NOR-SRP-01-30-00003987.0001001 / 16 NOV 11
Applicable to: ALL

If V2 is not inserted, the speed reference system (SRS) will not engage for takeoff.
5 s after lift off, V/S mode will engage. When V/S engages the current airspeed becomes the FCU target speed.

To regain a normal speed target, the pilot must :

SELECT the appropriate climb speed on the FCU and PULL out the knob.

- **At ACC ALT :**

  PUSH the A/THR pb on the FCU.

  SET the thrust levers to CL detent.

  PUSH in the SPD selector knob to get a managed speed target.

TAKEOFF USING THE LOCALIZER OF THE OPPOSITE RUNWAY

Ident.: PRO-NOR-SRP-01-30-00003988.0003001 / 09 OCT 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02321

- **If the localizer, of the ILS associated with the opposite runway, must be used for takeoff:**

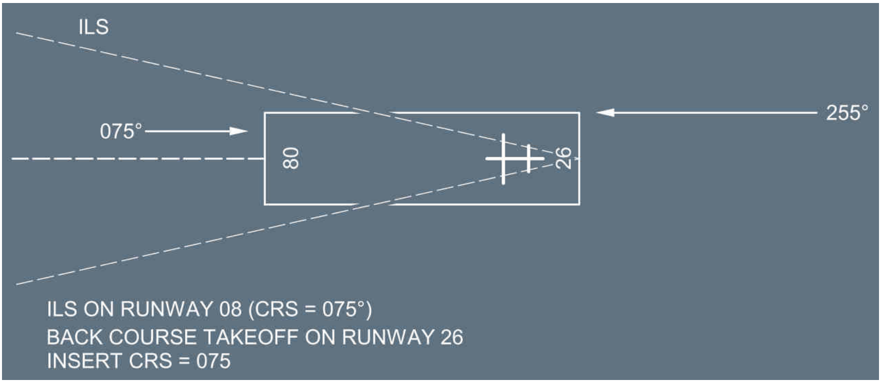
  SELECT the RAD NAV PAGE.

  ENTER the ILS IDENT.

  If the ILS is in the database, the system tunes the proper frequency.
  Check that the ILS front course is displayed in the CRS field.

  Note: This may trigger the "RWY/ILS MISMATCH" message. Disregard it.

- **If the ILS is not in the database:**
  SET the appropriate frequency, and SET the ILS front course in the CRS field.



ILS ON RUNWAY 08 (CRS = 075°)
BACK COURSE TAKEOFF ON RUNWAY 26
INSERT CRS = 075

DESELECT the LS pb on the FCU.

Since the PFD displays reverse deviation.

SELECT ROSE ILS on one ND.

TAKEOFF USING THE LOCALIZER OF THE OPPOSITE RUNWAY

RECOMMENDATION:

To ensure that you will not miss the next constraint, it is recommended to select the FCU altitude to the next constraint as described above.

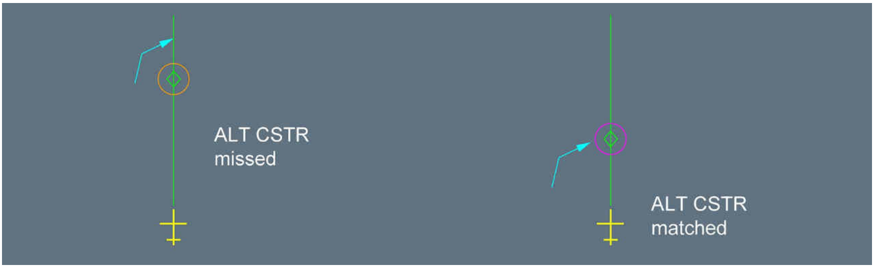
MONITORING THE CONSTRAINTS

SPEED, ALTITUDE and TIME constraint can be checked using MCDUs. Each constraint is preceded by a star that indicates if the constraint is matched (magenta star) or missed (amber star).

ALTITUDE CONSTRAINT

If an altitude constraint is predicted as missed, use the following procedure:

- SET the FCU ALT to the next ALT CSTR.
- CHECK the position of the level off symbol on the ND (blue arrow) with respect to the waypoint with the constraint.
- DECREASE the target speed until the constraint is met.



ALT CSTR
missed
ALT CSTR
matched

SPEED CONSTRAINT

CHECK the SPD CSTR predictions on the MCDU.

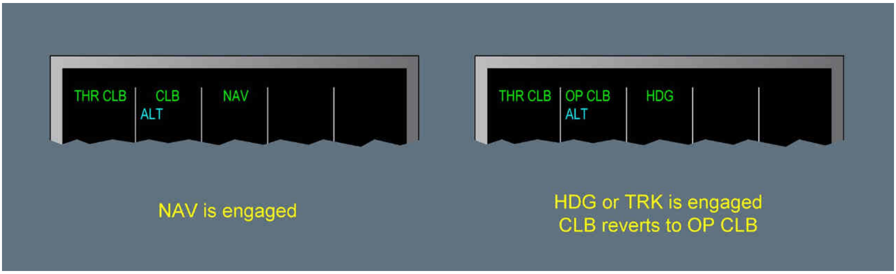
A magenta or amber star (*) indicates that the aircraft will match or miss the constraint.
If the aircraft is to miss the constraint by more than 10 kt, the MCDU scratchpad displays "SPD ERROR AT WPT ---- ".

"CHECK WEIGHT" MESSAGE.

Refer to DSC-22_20-90-20 "CHECK WEIGHT" Message

HDG/TRK MODE ENGAGEMENT

If HDG/TRK is engaged, the guidance does not consider any F-PLN constraint. Therefore, if the flight crew disengages NAV, CLB mode reverts to OP CLB.



THR CLB
CLB
ALT
NAV

ALT
HDG
HDG or TRK is engaged
CLB reverts to OP CLB

SPEED SELECTION

If a specific speed is required TURN and PULL the SPD selector knob. (This changes the target speed to blue on the PFD speed scale).
Predictions on the F-PLN page assume that the speed remains selected until the next SPD LIM or SPD CSTR, or the next phase, whichever comes first.

MONITORING THE CLIMB PHASE

RECOMMENDATION:

To ensure that you will not miss the next constraint, it is recommended to select the FCU altitude to the next constraint as described above.

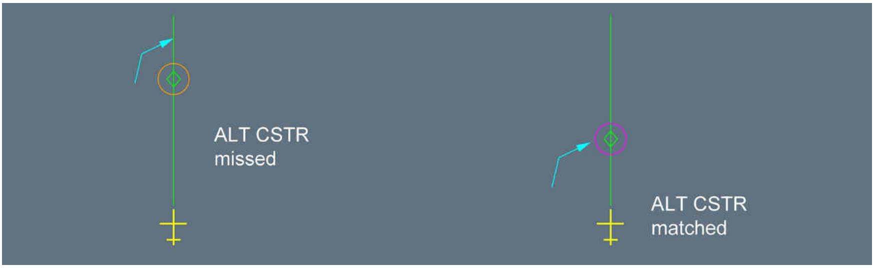
MONITORING THE CONSTRAINTS

SPEED, ALTITUDE and TIME constraint can be checked using MCDUs. Each constraint is preceded by a star that indicates if the constraint is matched (magenta star) or missed (amber star).

ALTITUDE CONSTRAINT

If an altitude constraint is predicted as missed, use the following procedure:

- SET the FCU ALT to the next ALT CSTR
- CHECK the position of the level off symbol on the ND (blue arrow) with respect to the waypoint with the constraint.
- DECREASE the target speed until the constraint is met.



ALT CSTR
missed
ALT CSTR
matched

SPEED CONSTRAINT

CHECK the SPD CSTR predictions on the MCDU.

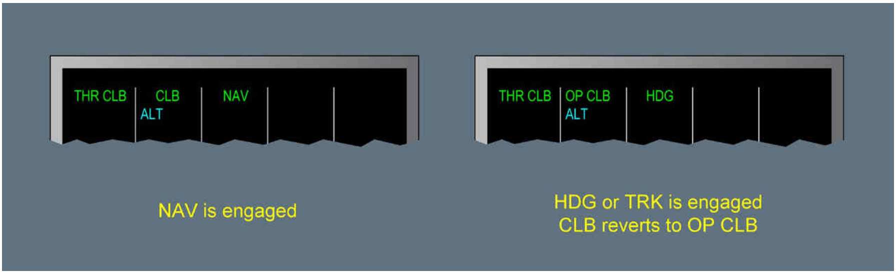
A magenta or amber star (*) indicates that the aircraft will match or miss the constraint.
If the aircraft is to miss the constraint by more than 10 kt, the MCDU scratchpad displays “SPD ERROR AT WPT ---- ”.

“CHECK WEIGHT” MESSAGE.

Refer to DSC-22_20-90-20 "CHECK WEIGHT" Message

HDG/TRKMODE ENGAGEMENT

If HDG/TRK is engaged, the guidance does not consider any F-PLN constraint. Therefore, if the flight crew disengages NAV, CLB mode reverts to OP CLB.



THR CLB
CLB
ALT
NAV
NAV is engaged
THR CLB
OP CLB
ALT
HDG
HDG or TRK is engaged
CLB reverts to OP CLB

SPEED SELECTION

If a specific speed is required TURN and PULL the SPD selector knob. (This changes the target speed to blue on the PFD speed scale).
Predictions on the F-PLN page assume that the speed remains selected until the next SPD LIM or SPD CSTR, or the next phase, whichever comes first.

EXPEDITE CLIMB

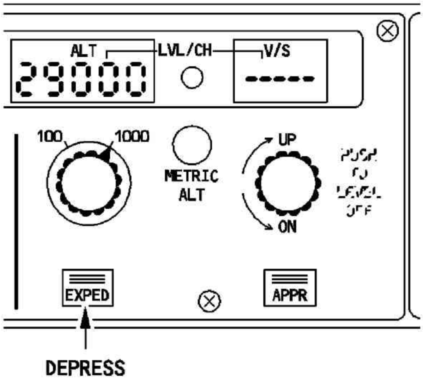
Ident.: PRO-NOR-SRP-01-40-00003990.0002001 / 11 FEB 11

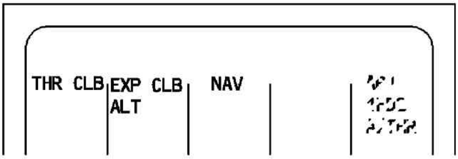
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The flight may use the expedite mode temporarily to clear a specified altitude or to match a constraint.

PRESS EXPED pb on the FCU.

The AP acquires and maintains Green Dot speed. There is no benefit to use expedite mode above FL 250. The mach corresponding to green dot is too low to maintain an increased vertical speed.





FMA in EXPEDITE CLB

To revert to normal climb:
PUSH ALT knob CLB mode will engage.

Note: Pulling ALT knob or V/S knob or SPD/MACH knob also disengages EXPEDITE. PRESSING EXPED pb never disengages the mode.

IMMEDIATE RETURN TO ORIGIN AIRPORT

Ident.: PRO-NOR-SRP-01-40-00003991.0003001 / 23 JUN 15

PERFORM a lateral revision at TO waypoint
ENTER the departure airport ident in the NEW DEST field.

PERFORM a lateral revision at the new destination

SELECT: APPR – STAR – VIA – TRANS and INSERT

CHECK and INSERT the TMPY F-PLN or continue with next revision.

- **When cleared to divert:**

  PERFORM a DIR TO the suitable waypoint.

  ENTER QNH, WIND, MDA/MDH, LDG CONF.

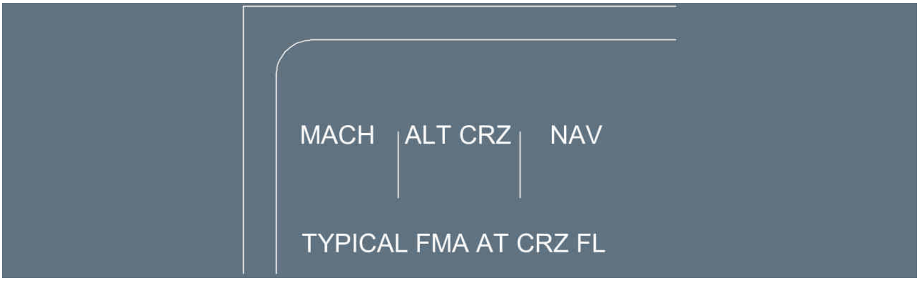
  CHECK RAD NAV page.

Cruise

REACHING CRUISE FLIGHT LEVEL

Ident.: PRO-NOR-SRP-01-50-00003992.0002001 / 03 NOV 14
Applicable to: ALL

On reaching the cruise flight level, the flight crew should be sure that the FMA displays “ALT CRZ” in its second column, which ensures that the aircraft is at cruise flight level and at Economy Cruise Mach (ECON CRZ MACH).



The FMGS engages the “soft altitude” (SOFT ALT) mode 2 min after the cruise flight level is captured and Mach stabilized. (SOFT ALT) mode allows the aircraft to deviate ± 50 ft from the target altitude to minimize the thrust variation and reduce the fuel consumption.

- **If the FMA does not display ALT CRZ at the assigned flight level,** soft altitude mode will not engage and the predictions will be computed at the preplanned flight level. This will occur when the ATC assigned flight level is lower than the preplanned flight level entered on the PROG page.

- **If the FMA does not display ALT CRZ at the assigned FL (as may occur when the ATC-assigned FL is lower than the preplanned FL selected initially):**

  PRESS the [PROG].

  ENTER the current cruise flight level.

  Note: *If the current cruise flight level is above the preplanned FL, selecting the FCU updates it automatically.*

“SET SPD AUTO” OR “SET MANAGED SPD” OR “CHECK SPEED MODE”

- **If the climb phase was flown in selected speed and if the cruise phase is planned to be flown in managed speed (ECON MACH/SPEED)** , “SET SPD AUTO” or “SET MANAGED SPEED” or "CHECK SPEED MODE" appears on the PFD and MCDU as a reminder.

PRESS the FCU speed selector knob to activate the managed Mach.

MONITORING THE NAVIGATION ACCURACY

Ident.: PRO-NOR-SRP-01-50-A-00003993.0001001 / 22 MAY 12
Applicable to: ALL

GENERAL

On aircraft equipped with GPS PRIMARY, the navigation accuracy check is not required as long as GPS PRIMARY ◁ is available.
Otherwise, navigation accuracy shall be checked periodically in cruise.

The PROG page displays an estimated accuracy as being high or low (center of sixth line):
- “HIGH” means that the FMGS estimates the FM position accurate enough to meet the EN ROUTE criteria,
- “LOW” means that the pilot must compare raw data from tuned navaids with corresponding data computed by FM and shown on the ND or MCDU PROG page. The appearance of the message “NAV ACCUR DOWNGRAD” on the MCDU calls for a similar crosscheck.

Note: *The pilot should make such a comparison periodically, even if the PROG page is displaying “HIGH” and navaids are available: this allows him to quantify the FM position error.*

The method for checking the accuracy is explained in the SOP and in Evaluation of position accuracy chapter (*Refer to DSC-22_20-20-20 General*).
A quick check is explained here below when the TO waypoint is a DME type. (VOR/DME or VOR/TAC or DME or TAC)

MONITORING THE FUEL PREDICTIONS

Ident.: PRO-NOR-SRP-01-50-00003995.0013001 / 14 FEB 11
Applicable to: ALL

The F-PLN and FUEL PRED pages display fuel and time predictions throughout the flight. These predictions are meaningful if the lateral and vertical flight plan, and the entered winds are kept accurate enough as the flight progresses.

PROCEDURE

In addition to the Fuel Management procedure described in the SOPs (*Refer to PRO-NOR-SOP-15 Cruise - Flight Progress*), periodically apply the following actions:

KEEP ACCURATE FMS PREDICTIONS

Periodically UPDATE the F-PLN elements (F-PLN waypoints, step altitudes, predicted winds).

CHECK the MIN DEST FOB value on the FUEL PRED page

The MIN DEST FOB value is computed by the FMS and by default it is equals to ALTN + FINAL.
ALTN, FINAL and MIN DEST FOB can be modified by the flight crew.
At the beginning of the CRZ phase, and/or after any change of destination or alternate airport, check that the MIN DEST FOB value is meaningful. Otherwise, update the MIN DEST FOB value, as appropriate.

CHECK the DEST EFOB value on the F-PLN or FUEL PRED page

MONITOR the EFOB at destination on the F-PLN or FUEL PRED page. If necessary, ADAPT the flight strategy.

"DEST EFOB BELOW MIN" MESSAGE

If the predicted EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page:

- The destination EFOB turns to amber on the F-PLN, FUEL PRED and PERF (CLB, CRZ, DES) pages, and REPORT page.
- The “DEST EFOB BELOW MIN” amber message is displayed on the MCDU scratchpad, after 2 min (if the FMS is in CRZ or DES phase).

Note: *If the flight crew has cleared the “DEST EFOB BELOW MIN” message, and if the predicted EFOB at destination is still less than the MIN DEST FOB value, the “DEST EFOB BELOW MIN” message will appear again at the beginning of the descent phase.*

PROCEDURE

● **If the “DEST EFOB BELOW MIN” message is triggered on the MCDU:**

CHECK the DEST EFOB value on the F-PLN or FUEL PRED page,

CHECK the hypothesis used by the FMS to compute the fuel predictions,

Check that the F-PLN elements (F-PLN waypoints, step altitudes, predicted winds) are up-to-date, to ensure that the FMS predictions are accurate.
Check that the MIN DEST FOB fuel value is meaningful and corresponds to the planned fuel strategy.

ADAPT the flight strategy as required.

ENTERING A STEP CLIMB OR A STEP DESCENT

Ident.: PRO-NOR-SRP-01-50-00003996.0002001 / 22 MAY 12

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The crew may use the STEP ALTS page to enter up to four geographic step points or one optimal step (computed by the FMGS) at any waypoint of the cruise.

PROCEDURE

PRESS the PERF key.
SELECT “STEP ALTS” prompt.

The PERF PAGE displays this prompt in cruise phase. The crew may also call up the STEP ALTS page using a vertical revision at any cruise waypoint.

ENTERING AN OPTIMAL STEP (ONLY STEP CLIMB)

WRITE a step altitude or FL into the scratchpad.
ENTER the step altitude or FL in the [1R] field.
CHECK the FUEL and TIME SAVINGS predictions on the 5L and 5R fields.
PUSH the INSERT prompt [6R] if adequate.

After insertion, the optimum step climb is updated only when the flight crew presses the UPDATE prompt [6R].
The ND shows symbols for the start of climb (S/C) and the top of climb (T/C). The MCDU shows the associated pseudo-waypoints.
It is possible to convert an optimum step to a geographic step by overwriting the [1L] field (see geographic step).

- **When reaching the step climb pseudo-waypoint:**
  REQUEST climb clearance.
  ADJUST the FCU altitude to the STEP ALT, and PUSH.

INSERTED OPT STEP ALT

ENTERING A GEOGRAPHIC STEP

WRITE a step altitude into the scratchpad.

The format is position/altitude (or FL). The position can be a waypoint or waypoint/distance to waypoint. The waypoint/distance is an along track offset waypoint.

ENTER it in [1L] to [4L] field.

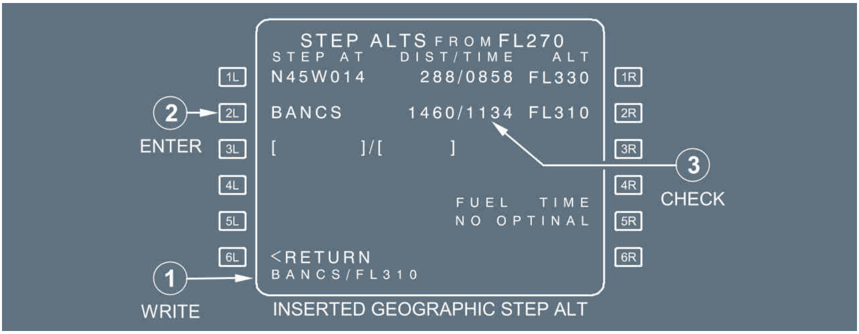
The entry of the initial geographic step point requires both a valid waypoint and altitude entries. When a step has been entered, the flight crew may change the position and the altitude independently. The flight crew cannot modify the position and the altitude in a single entry: To modify both, they should modify the position first, and then the altitude.

CHECK the predictions

- **When reaching the step climb or descent pseudo-waypoint (S/C or S/D):**

  REQUEST climb or descent clearance.

  ADJUST the FCU altitude to the STEP ALT, and PUSH.



INSERTED GEOGRAPHIC STEP ALT

The DIST/TIME field may display the following messages:

- ABOVE MAX if the step altitude exceeds the MAX ALT.
- IGNORED if the start step point is less than 50 NM from the top of descent.
- STEP NOW when the aircraft is within 20 NM of the step point.
  If the aircraft overflies the step waypoint without commencing a climb or a descent, the system deletes the step from the vertical F-PLN automatically (a “STEP DELETED” message is displayed on the MCDU scratchpad), and recomputes the predictions.
  A step is not deleted if the FCU altitude is moved only partially towards the step altitude.
  The flight phase remains “cruise” whenever a step is initiated.

Note: *For an altitude restriction defined at a waypoint less than 50 NM before the top of descent and lower than the CRZ FL, it is recommended to enter an altitude constraint rather than a step.*

ENTERING A STEP CLIMB OR A STEP DESCENT

Ident.: PRO-NOR-SRP-01-50-00003996.0012001 / 22 MAY 12
Applicable to: MSN 04827-04860

The crew may use the STEP ALTS page to enter up to four geographic step points or one optimal step (computed by the FMGS) at any waypoint of the cruise.

PROCEDURE

PRESS the F-PLN key on the MCDU.
SELECT the VERT REV page at any waypoint.
SELECT “STEP ALTS” prompt.

The PERF PAGE displays this prompt in cruise phase. The crew may also call up the STEP ALTS page using a vertical revision at any cruise waypoint.

ENTERING AN OPTIMAL STEP (ONLY STEP CLIMB)

WRITE the desired step altitude into the scratchpad.
ENTER it in the [1L] field

The FMGS automatically computes the optimal location of the step and inserts it in the TMPY F-PLN.

CHECK the FUEL and TIME SAVINGS predictions on the [5R].

After insertion, the optimum step location is regularly updated, until the aircraft is within 20 NM of the step point.
The ND shows symbols for the start of climb (S/C) and the top of climb (T/C). The MCDU shows the associated pseudo-waypoints.
It is possible to convert an optimum step to a geographic step by overwriting the [1L] field (see geographic step).

STEP ALT BEFORE INSERTION

INSERTED OPT STEP ALT

- **When reaching the step climb pseudo-waypoint (S/C):**
  REQUEST climb clearance to ATC.
  ADJUST the FCU altitude to the STEP ALT, and PUSH the FCU knob.

Note: *The step will be deleted from the F-PLN after having sequenced the start of climb for the step.*

ENTERING A GEOGRAPHIC STEP (STEP CLIMB OR STEP DESCENT)

WRITE a step altitude and waypoint into the scratchpad.

The format is:
- *Altitude (or FL)/waypoint (Ex: FL 350/BERAD)*
- *Altitude (or FL)/waypoint/distance (Ex: FL 350/BERAD/-20)*

The waypoint must be in the flight plan.

ENTER it in [1L] to [4L] field.

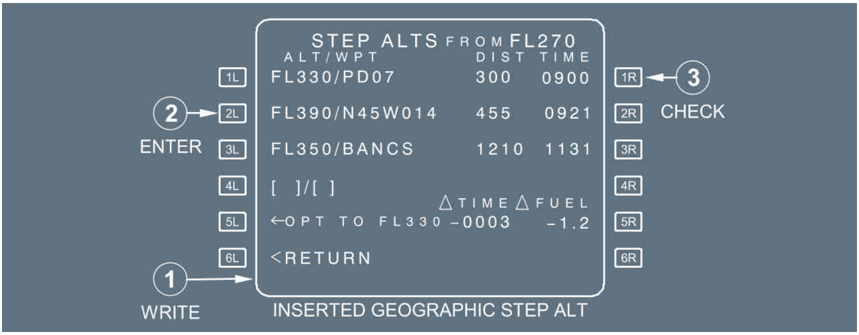
It is possible to independently modify either the location or the altitude of an existing step altitude. It is not possible to modify with a single entry both the location and the altitude : An entry "waypoint/xxx" will be taken by the system as an along track offset of xxx nautical miles.

CHECK the predictions (distance, time).

- **When reaching the step climb or descent pseudo-waypoint (S/C or S/D):**

  REQUEST climb or descent clearance

  ADJUST the FCU altitude to the STEP ALT, and PUSH the FCU knob.



```
      STEP ALTS FROM FL270
 ALT/WPT                  DIST  TIME
FL330/PD07                 300  0900

FL390/N45W014              455  0921

←OPT TO FL330         -0003  -1.2

<RETURN
```

INSERTED GEOGRAPHIC STEP ALT

The DIST/TIME field may display the following messages:

- ABOVE MAX if the step altitude exceeds the MAX ALT.
- IGNORED if the step end point is less than 50 NM from the top of descent or if the step climb is located prior to the top of climb or after the top of descent.
- STEP AHEAD when the aircraft is within 20 NM of the step point.

  If the aircraft overflies the step pseudo-waypoint without commencing a climb or a descent, the system deletes the step from the vertical F-PLN automatically (a "STEP DELETED" message is displayed on the MCDU scratchpad), and recomputes the predictions.

  The step is not deleted if the FCU altitude is moved only partially towards the step altitude.

  The flight phase remains "cruise" whenever a step is initiated.

<u>Note:</u> *For an altitude restriction defined at a waypoint less than 50 NM before the top of descent and lower than the CRZ FL, it is recommended to enter an altitude constraint rather than a step.*

IMMEDIATE CHANGE OF LEVEL IN CRUISE

Ident.: PRO-NOR-SRP-01-50-00003997.0001001 / 14 FEB 11
3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

When the pilot changes his flight level without inserting a step:

- If the FCU-selected altitude is above the previous CRZ FL, the CRZ FL on the PROG page changes to the new flight level.
- If the FCU-selected altitude is lower than the previous CRZ FL and if the distance to DEST is more than 200 NM, the CRZ FL on the PROG page changes.

  In that case Mach target is managed as follows:
  - At the start of the descent, the Mach target is the managed Mach number at the initial cruise flight level.
  - When the aircraft reaches the new flight level, the Mach target switches either to the Mach number for the lower CRZ FL, or to the speed for the lower CRZ FL if the aircraft reaches the crossover altitude. This logic prevents the aircraft from exceeding VMO during descent.
- If the FCU-selected altitude is lower than the previous CRZ FL and the aircraft is within 200 NM of its destination, the system activates the descent phase.

The pilot may reactivate the cruise phase by entering a new cruise flight level in the PROG page.

IMMEDIATE CHANGE OF LEVEL IN CRUISE

Ident.: PRO-NOR-SRP-01-50-00003997.0002001 / 14 FEB 11
Applicable to: MSN 04827-04860

When the flight crew changes the flight level through a FCU altitude selection:

- If the FCU-selected altitude is above the previous CRZ FL, the CRZ FL on the PROG page changes to the new flight level.
- If the FCU-selected altitude is lower than the previous CRZ FL and if the distance to DEST is more than 200 NM, the CRZ FL on the PROG page changes.

  In that case Mach target is managed as follows:
  - At the start of the descent, the Mach target is the managed Mach number at the initial cruise flight level.
  - When the aircraft reaches the new flight level, the Mach target switches either to the Mach number for the lower CRZ FL, or to the speed for the lower CRZ FL if the aircraft reaches the crossover altitude. This logic prevents the aircraft from exceeding VMO during descent.
- If the FCU-selected altitude is lower than the previous CRZ FL and the aircraft is within 200 NM of its destination, the system activates the descent phase.

The pilot may reactivate the cruise phase by entering a new cruise flight level in the PROG page.

CAUTION	If the pilot modifies the CRZ FL on the PROG page without setting the FCU altitude, the FMS may target a Speed/Mach above VMO/MMO. Changing the FCU altitude makes the FMS behavior become correct again.

PREPARATION FOR DESCENT AND APPROACH

Ident.: PRO-NOR-SRP-01-50-B-00003998.0001001 / 09 DEC 09
Applicable to: ALL

GENERAL

The preparation for descent and approach consists of :
- Entering PERF and WIND data
- Defining the lateral and vertical F-PLN
- Checking the tuning (auto or manual) of the appropriate navaids

After receiving the arrival information, the flight crew should use the following procedure.

Ident.: PRO-NOR-SRP-01-50-B-00003999.0001001 / 22 MAY 12

PERFORM a lateral revision at destination

SELECT an ARRIVAL

SELECT an APPROACH, a STAR, a TRANSITION, a VIA.

When the pilot selects successive items, the page are automatically sequenced. But pressing "NEXT PAGE" key brings up the APPR and STAR page successively.

CHECK the temporary revision including the missed approach.

INSERT the temporary revision, [6R] key.

REVISION OF VERTICAL FLIGHT PLAN

CHECK that the speed and altitude constraints as displayed on the ND. (Use the CSTR pusbutton).

ENTER any additional speed or altitude constraints using the vertical revision page.

In order not to be too fast when commencing the approach, you may insert a speed constraint at the FAF (Final Approach Fix).
When all computations are completed.

REVIEW the flight plan, using the approach chart.

When the destination runway changes and if the previously selected STAR is compatible with the new runway, the system selects it automatically in the temporary F-PLN. If the flight crew has entered any revision or constraint on this STAR, it will not be transferred.
The pilot must reenter it in order to retain it for this approach.

PRESELECTING A MANAGED SPEED/MACH

As long as the descent phase is not active, the PERF DES page may either be used to select a speed, or a Mach number, or both, to replace the optimum descent speed.
The Flight Guidance Computer then uses the entered speed, instead of the optimum speed for computing the descent profile.
When the system switches to the descent phase, it sets the MANAGED target speed to the entered speed. From there, the speed may only be modified by using the FCU selector knob.
Once in descent phase, the pilot cannot modify the MANAGED speed again.

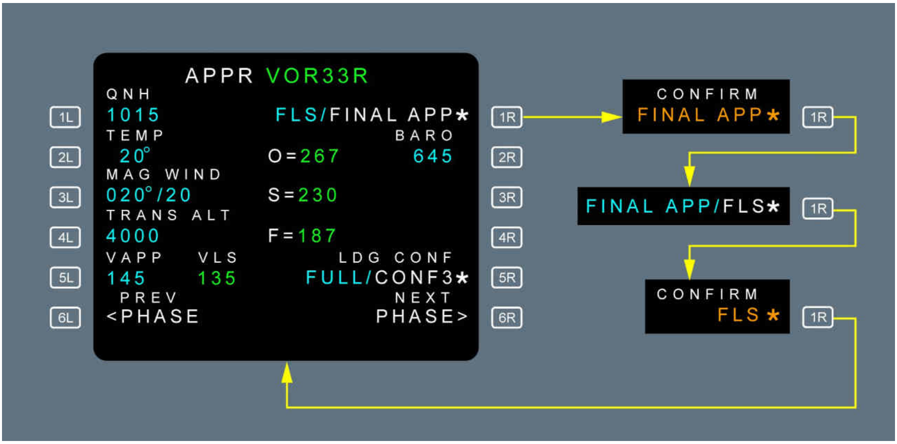
ENTERING THE APPROACH DATA

From PERF DES page, SELECT “NEXT PHASE” [6R] key to display the APPR page.
Select the appropriate guidance mode (FLS or FINAL APP), if a non precision approach is inserted in the F-PLN.

Note: 1. *FLS is the recommended guidance mode for non precision approaches, except for RNAV(RNP) approaches.*
2. *If an RNAV(RNP) approach is selected or if the FLS guidance mode is not available for the selected approach, FINAL APP guidance mode is automatically selected. In such case FINAL APP is displayed in green on the MCDU page.*

Note: *If a non precision approach is inserted in the F-PLN, the default guidance mode is FLS.*



```

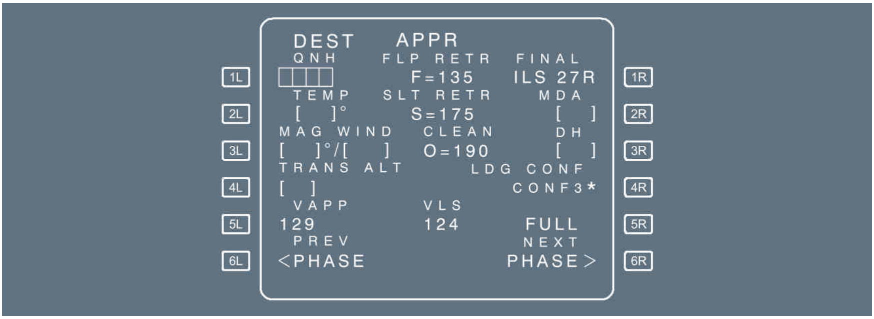
ENTERING THE APPROACH DATA

From PERF DES page, SELECT “NEXT PHASE” [6R] key to display the APPR page.
ENTER QNH, TEMP, WIND at destination (magnetic north reference), DH or MDA (MDH depending on the OPC option).

(The PFD displays the MDA/MDH or DH only when the distance to destination is less than 250 NM).

CHECK and, if necessary, MODIFY
- LDG CONF (landing configuration),
- VAPP (the FM-computed value may be modified),
- TRANS ALT (transition altitude).



```
  DEST     APPR
  QNH     FLP RETR    FINAL
□□□□        F=135    ILS 27R
  TEMP    SLT RETR      MDA
  [  ]°     S=175     [   ]
MAG WIND    CLEAN        DH
[  ]°/[  ]  O=190     [   ]
TRANS ALT          LDG CONF
[  ]                 CONF3*

```

Ident.: PRO-NOR-SRP-01-50-B-00004004.0027001 / 19 APR 17
Applicable to: MSN 04827-04860

ENTERING THE APPROACH DATA

From PERF DES page, SELECT “NEXT PHASE” [6R] key to display the APPR page.
ENTER QNH, TEMP, WIND at destination (magnetic north reference), minimum in the RADIO or BARO fields.

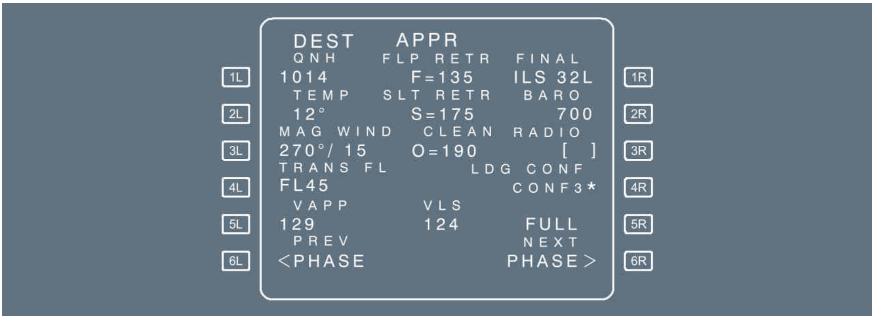
(The PFD displays the entered BARO or RADIO minimum value, only when the distance to destination is less than 250 NM).

CHECK and, if necessary, MODIFY the LDG CONF (landing configuration)
CHECK, and if necessary MODIFY the VAPP

The FMS-computed value may be modified

CHECK the TRANS FL value

(see note 1 below)

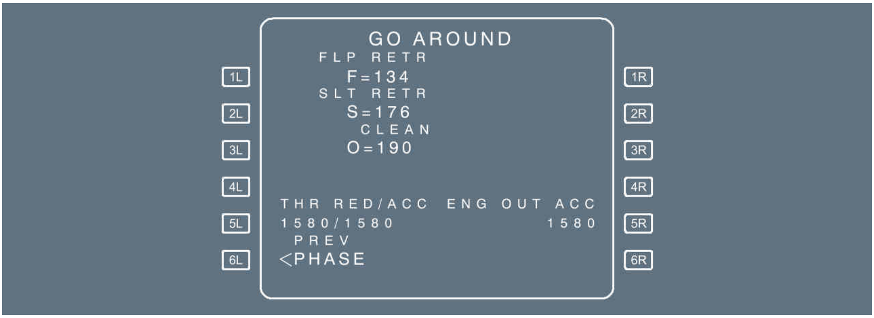


```
  DEST     APPR
  QNH     FLP RETR    FINAL
1014        F=135   ILS 32L
  TEMP    SLT RETR     BARO
  12°       S=175       700
MAG WIND    CLEAN     RADIO
270°/ 15    O=190     [   ]
TRANS FL          LDG CONF
FL45                CONF3*
  VAPP      VLS
129         124        FULL
  PREV                 NEXT
<PHASE               PHASE>
```

Note: *1. The default TRANS FL value is computed by the FMS based on:*
- *The Transition Altitude of the destination airport (extracted from the NAV Database),*
- *The QNH value entered on PERF APPR page. Due to the internal FMS computation of altitude constraints, it is rounded to the upper multiple of 5.*
  If this computed TRANS FL value differs by more than 500 ft from the Transition Level specified on the approach chart or reported by ATC, the flight crew may modify the TRANS FL value.

2. The scratchpad displays "ENTER DEST DATA" if the PERF APPR page has not been completed when the aircraft is less than 180 NM from destination.

SELECT "NEXT PHASE" in order to display the GO AROUND page.
CHECK and, if necessary, MODIFY the THR RED ALT and the ACC ALT.



```
          GO AROUND
     FLP RETR
        F=134
     SLT RETR
        S=176
          CLEAN
        O=190

Descent

DESCENT INITIATION

Ident.: PRO-NOR-SRP-01-60-00004007.0001001 / 17 MAY 21
Applicable to: ALL

The top of descent, displayed on the F-PLN page (T/D) and on the ND (↘), is a position that the system calculates, assuming that the aircraft will begin its descent in DES mode with managed speed, and that the system will guide the aircraft along the descent profile computed with all the vertical F-PLN data (ALT CSTR, ECON or AUTO MACH/SPD, SPD CSTR, SPD LIMIT) to reach VAPP at 1 000 ft AGL.

Note: *The ND does not display the top of descent ↘ when HDG (or TRACK) mode is engaged.*

PROCEDURES

- **When the aircraft reaches the top of descent (T/D) :**

  SELECT the altitude target.

  PUSH the ALT selector knob. DES mode engages.

  CHECK the FMA annunciators.

DESCENT MONITORING

Ident.: PRO-NOR-SRP-01-60-A-00004008.0004001 / 06 JUN 16
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

DES MODE ENGAGED

When DES mode is engaged, NAV mode is engaged, and the system takes into account all altitude and speed constraints of the F-PLN.
The key parameter for monitoring the descent is the vertical deviation (VDEV) displayed on the PFD and on the PROG page, which indicates whether the aircraft is on, above, or below the descent profile.

PROCEDURE

SET the ATC-cleared altitude on the FCU (considering also what is the safe altitude).

If the lowest safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.
If it is confirmed, SET the FCU altitude to the safe altitude until it is safe to go to the ATC-cleared altitude.

MONITOR the vertical deviation (VDEV) on the PFD and the PROG page.

MONITOR the speed change that occurs, when the aircraft reaches a speed change symbol (magenta ball) under managed speed.
MONITOR the FMA (ALT*, ALT CST*, ALT, ALT CST) when the aircraft reaches level symbols.

- **If the aircraft is on the descent profile:**

  The aircraft is considered to be on the vertical profile, when it is within 50 ft of it. VDEV is close to zero, and the system predicts that it will match constraints until the aircraft levels off at the next FCU altitude.

  MONITOR the predicted descent point after the next level-off.

  The A/THR adjusts the thrust for the particular segment. The first FMA column may display "THR IDLE" or "SPEED".

- **If the rate of descent has to be increased (ATC requirement):**

  SELECT OP DES mode

  Increase the target speed or extend the speedbrakes.

Ident.: PRO-NOR-SRP-01-60-A-00004008.0032001 / 06 JUN 16

Applicable to: MSN 04827-04860

DES MODE ENGAGED

When DES mode is engaged, NAV mode is engaged, and the system takes into account all altitude and speed constraints of the F-PLN.
The key parameter for monitoring the descent is the vertical deviation (VDEV) displayed on the PFD and on the PROG page, which indicates whether the aircraft is on, above, or below the descent profile.

PROCEDURE

SET the ATC-cleared altitude on the FCU (considering also what is the safe altitude).

If the lowest safe altitude is higher than the ATC-cleared altitude, check with ATC that this constraint applies.
If it is confirmed, SET the FCU altitude to the safe altitude until it is safe to go to the ATC-cleared altitude.

MONITOR vertical deviation (VDEV) on the PFD and the PROG page.
MONITOR the speed change that occurs, when the aircraft reaches a speed change symbol (magenta ball) under managed speed.
MONITOR the FMA (ALT*, ALT CST*, ALT, ALT CST), when the aircraft reaches level symbols.

■ **If the aircraft is on the descent profile:**

The aircraft is considered to be on the vertical profile, when it is within 50 ft of it. VDEV is close to zero, and the system predicts that it will match constraints until the aircraft levels off at the next FCU altitude.

MONITOR the predicted descent point after the next level-off.

A/THR adjusts thrust for the particular segment. The first FMA column may display “THR IDLE” or “SPEED”.

Procedure

SELECT a descent speed higher than the upper limit when possible.

MONITOR the intercept symbol .

When this symbol reaches the next ALT CSTR waypoint, "MORE DRAG" appears on the PFD, indicating that speedbrakes must be extended in order to match the next altitude constraint. This is an advisory message.

Note: *With DPO , when above the descent profile, the flight crew may have to extend the speed brakes in order to go back on the descent profile.*

- **If an altitude constraint is predicted to be missed by more than 250 ft** the vertical revision page shows ALT ERROR at the waypoint.

```

- **If a speed constraint is predicted to be missed by more than 10 kt:**
  SELECT an appropriate speed.
  RESUME managed speed when the aircraft is back on the descent profile.

■ **If the aircraft is below the descent profile**

VDEV is up on the PFD and negative on the PROG page. The system maintains the target speed (managed or selected speed).

MONITOR the intercept symbol ([]) on the ND and any leveling off at the next ALT CSTR.

● **If the aircraft is flying at an altitude that is higher than both the descent speed limit altitude and the destination elevation +5 000 ft:**

The FMGS maintains the V/S at -1 000 ft/min and the target speed, until the aircraft reaches the altitude constraint or intercepts the descent profile.

■ **If the aircraft is flying at an altitude that is lower than either the descent speed limit altitude, or the destination elevation +5 000 ft:**
The FMGS maintains the V/S at -500 ft/min and the target speed, until the aircraft intercepts either the altitude constraint or the descent profile.

F.PLN A PAGE WITH A TOO STEEP PATH

PROCEDURE

- **When passing the first waypoint of the TOO STEEP PATH:**

  MONITOR VDEV and predictions at the next CSTR waypoint.
  If required, EXTEND the speedbrakes before seeing the “MORE DRAG” message.
  CONSIDER using a holding pattern, if necessary.

HOLDING PATTERN

Ident.: PRO-NOR-SRP-01-60-00004014.0001001 / 09 OCT 12
Applicable to: ALL

A hold may be required during the descent, and may be manually inserted.

PROCEDURE

PRESS the F-PLN key.
SELECT the lateral revision page.
SELECT the HOLD prompt.
CHECK the HOLDING data, and MODIFY it if necessary.
CHECK the temporary flight plan and INSERT the holding pattern in it.

Note: *If the holding fix is close to the DECEL pseudo waypoint and the speed is managed, manually activate the approach phase to change the managed target speed to approach speed (VAPP). This will avoid having an increase of speed not appropriate.*

MANUAL TERMINATION

Ident.: PRO-NOR-SRP-01-60-00004016.0001001 / 09 DEC 09
Applicable to: ALL

You should not use DES mode when entering a leg with manual termination. Manual termination, which is defined as a track or a heading with no termination, is always part of a database procedure. The computed descent flight profile may not be adequate when flying this type of leg.

Approach

INITIAL APPROACH

Ident.: PRO-NOR-SRP-01-70-00004017.0002001 / 26 NOV 19

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

UPON REACHING THE INITIAL APPROACH AREA

- Approach phase activates automatically when flying over the DECEL pseudo waypoint with NAV, APP NAV or LOC* or LOC mode engaged.
- Approach phase needs a manual activation on the PERF page in case of one of the following:
  - HDG / TRK mode is engaged, or
  - After a go around, or
  - An early deceleration is required.

- **If ATC requires a specific speed:**

  SWITCH to selected speed (turn and pull the speed selector knob on the FCU).

  ADJUST the aircraft configuration accordingly.

- **If ATC orders successive step descents down to the final approach flight path:**

  Use the V/S or FPA mode.

  MONITOR VDEV.

NAV ACCURACY

As required by the SOP.
Without installed GPS and when no DME is available for the accuracy check, use HIGH/LOW on the PROG page.
In this case, consider a “HIGH” to be equivalent to a positive crosscheck.

ATC CLEARANCE

MODIFY the F-PLN, RAD NAV, and PERF APPR data to agree with the latest clearance and landing information.

INITIAL APPROACH

2 Ident.: PRO-NOR-SRP-01-70-00004017.0015001 / 26 NOV 19
Applicable to: MSN 11531

UPON REACHING THE INITIAL APPROACH AREA

- Approach phase activates automatically when flying over the DECEL pseudo waypoint with NAV, LOC*, LOC, F-LOC* or F-LOC mode engaged.
- Approach phase needs a manual activation on the PERF page in case of one of the following:
  - HDG / TRK mode is engaged, or
  - After a go around, or
  - An early deceleration is required.

NAV ACCURACY

As required by the SOP.
For Non Precision Approaches flown with the FLS function, the flight crew must check the FLS capability.
Without installed GPS and when no DME is available for the accuracy check, use HIGH/LOW on the PROG page.

In this case, consider a "HIGH" to be equivalent to a positive crosscheck.

ATC CLEARANCE

MODIFY the F-PLN, RAD NAV, and PERF APPR data to agree with the latest clearance and landing information.

ILS/MLS/GLS/FLS/SLS APPROACH

Ident.: PRO-NOR-SRP-01-70-A-00004018.0001001 / 17 MAR 11

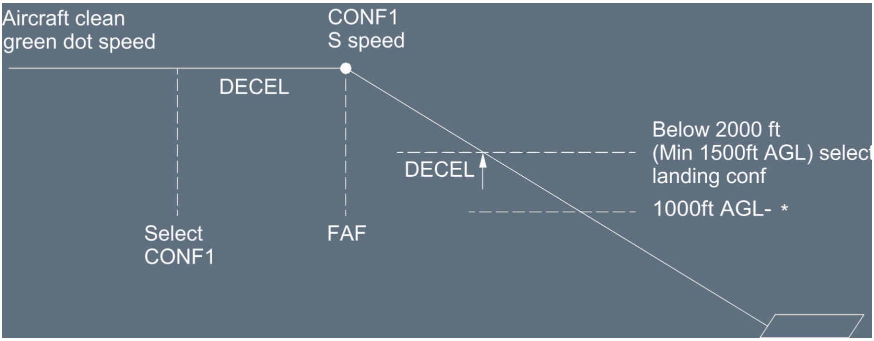
3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**

INTERMEDIATE/FINAL APPROACH (ILS APPROACH ENTERED IN THE F-PLN)

The preferred technique for flying an ILS approach is to fly a decelerated approach using the AP/FDs, the LOC and G/S modes, A/THR in the SPEED mode, managed speed target is recommended.

DECELERATED APPROACH

The decelerated approach technique brings the aircraft down to 1 000 ft, at VAPP. In most cases, the interception of the final descent path is achieved with CONF 1 at S speed.



(*) The approach must be stabilized at approach speed (minimum ground speed) in the landing configuration before reaching 1 000 ft AGL.

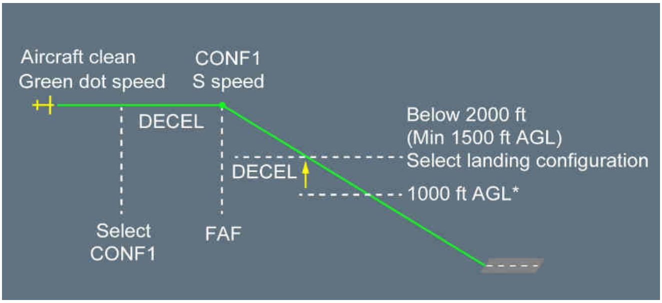
Ident.: PRO-NOR-SRP-01-70-A-00004018.0003001 / 12 MAY 22
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

INTERMEDIATE/FINAL APPROACH (ILS / GLS / LPV WITH SLS ◁) APPROACH ENTERED IN THE F-PLN)

The preferred technique for flying an ILS / GLS / LPV(with SLS ◁) approach is to fly a decelerated approach using the AP/FDs, the LOC and G/S modes, A/THR in the SPEED mode, managed speed target is recommended.

DECELERATED APPROACH

The decelerated approach technique brings the aircraft down to 1 000 ft, at VAPP. In most cases, the interception of the final descent path is achieved with CONF 1 at S speed.



(*) The approach must be stabilized at approach speed (minimum ground speed) in the landing configuration before reaching 1 000 ft AGL.

4 **Applicable to: MSN 10949-11597**

APPROACH MODE ACTIVATION (LOC - G/S)

- **When cleared by ATC and when appropriate:**

  PRESS the APPR pb on the FCU to arm the APPR mode for the approach entered in the flight plan.

  Note: *If a non precision approach is selected in the active flight plan and if the flight crew manually tunes an ILS / GLS ◁ on the RAD NAV page:*

  - *the MCDU and PFD display CHECK APPR SELECTION. This message is a reminder to the flight crew that this manually-tuned landing system does not correspond to the approach that is selected in the flight plan.*
  - *When the APPR pb is pressed on the FCU, the available approach guidance modes are LOC and G/S.*

The FCU APPR pb arms or engages LOC and G/S modes, if :

- An ILS / GLS / LPV (with SLS) approach is entered in the flight plan, or
- An ILS / GLS is manually-tuned on the RADIO NAV page, or
- Both RMPs are set to NAV, and an ILS / GLS is selected.

Ident.: PRO-NOR-SRP-01-70-A-00004019.0011001 / 17 MAR 11
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

APPROACH MODE ACTIVATION (LOC-G/S)

- **When cleared by ATC and when appropriate:**

DEPRESS the APPR pushbutton to arm the APPR mode for the approach entered in the flight plan.

Note: *If a NON PRECISION approach is selected in the active flight plan and if the flight crew manually tunes an ILS/GLS on the RAD NAV page, the MCDU and the PFD display "CHECK APPR SELECTION". This message is a reminder to the flight crew that, although an ILS/GLS is tuned on RAD NAV page, the available approach guidance modes are APP NAV-FINAL when the APPR pushbutton is pressed in on the FCU.*

The FCU APPR pushbutton arms or engages LOC and G/S modes, if:

- An ILS/GLS approach is entered in the flight plan, or
- No approach, or only a runway, is entered in the flight plan, and an ILS/GLS is manually-tuned on the RAD NAV page, or
- Both RMPs are set to NAV, and an ILS/GLS is selected.

Ident.: PRO-NOR-SRP-01-70-A-00004019.0009001 / 17 MAR 11
Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324

APPROACH MODE ACTIVATION (LOC-G/S)

- **When cleared by ATC and when appropriate:**

DEPRESS the APPR pushbutton to arm the APPR mode for the approach entered in the flight plan.

Note: *If a NON PRECISION approach is selected in the active flight plan and if the flight crew manually tunes an ILS on the RAD NAV page, the MCDU and the PFD display "CHECK APPR SELECTION". This message is a reminder to the flight crew that, although an ILS is tuned on RAD NAV page, the available approach guidance modes are APP NAV-FINAL when the APPR pushbutton is pressed in on the FCU.*

The FCU APPR pushbutton arms or engages LOC and G/S modes, if:
- An ILS approach is entered in the flight plan, or
- No approach, or only a runway, is entered in the flight plan, and an ILS is manually-tuned on the RAD NAV page, or
- Both RMPs are set to NAV, and an ILS is selected.

Ident.: PRO-NOR-SRP-01-70-A-00004019.0008001 / 17 MAR 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

APPROACH MODE ACTIVATION (LOC-G/S)

- **When cleared by ATC and when appropriate:**

DEPRESS the APPR pushbutton to arm the APPR mode for the approach entered in the flight plan.

Note: *If a NON PRECISION approach is selected in the active flight plan and if the flight crew manually tunes an ILS on the RAD NAV page, the MCDU displays "CHECK APPR SELECTION" and the PFD displays "CHECK APP GUIDANCE" or "CHECK APP SEL" (if CPIP3 installed). These messages are a reminder to the flight crew that, although an ILS is tuned on RAD NAV page, the available approach guidance modes are APP NAV-FINAL when the APPR pushbutton is pressed in on the FCU.*

The FCU APPR pushbutton arms or engages LOC and G/S modes, if:
- An ILS approach is entered in the flight plan, or
- No approach, or only a runway, is entered in the flight plan, and an ILS is manually-tuned on the RAD NAV page, or
- Both RMPs are set to NAV, and an ILS is selected.

AUTOLAND

CHECK that the FMA displays the aircraft capability (CAT 2 or CAT 3) for the intended ILS approach.
MONITOR the radio automatic callout.

- **At 350 ft RA:**

CHECK that LAND is displayed on the FMA.

CHECK ILS course.

Note: *If LAND is not displayed or if the ILS course is not correct, do not perform an autoland. The flight crew should perform a go-around, if visual references are not sufficient.*

- **At 40 ft RA:**

  CHECK that FLARE is displayed on the FMA.

- **At approximately 30 ft RA:**

  CHECK that IDLE is displayed on the FMA, and that autothrust starts to reduce thrust toward IDLE.

- **At 10 ft, “RETARD” callout comes up:**

  MOVE the thrust levers to IDLE.

L2 *Autothrust disconnects.*

L1

- **At touchdown:**

  CHECK that ROLL OUT appears on the FMA.

  Note: *In the case of tailwind during an automatic rollout, it is recommended to use manual braking without delay or automatic braking for an optimised runway centerline tracking.*

- **At the end of the Rollout:**

  Disconnect the autopilot.

L2 *If the flight crew does not disconnect the AP at the end of the rollout, and uses the nosewheel steering handwheel to taxi the aircraft off the runway, the following will occur:*

- *The AP will try to steer the aircraft back to the runway centerline, if the nosewheel steering handwheel is released and the aircraft heading is less than 20 ° off the runway centerline*
- *The AP will automatically disconnect, if the aircraft heading is 20 ° or more off the runway centerline.*

AUTOLAND

CHECK that the FMA displays the aircraft capability for the intended ILS/GLS approach (CAT2 or CAT3 for ILS, AUTO LAND for GLS).
MONITOR the radio automatic callout.

- **At 350 ft RA:**

  CHECK that LAND is displayed on the FMA.

  Note: *If LAND is not displayed, do not perform an autoland. The flight crew should perform a go-around, if visual references are not sufficient.*

CHECK ILS/GLS course.

Note: *If the ILS/GLS course is not correct, do not perform an autoland. In addition for CAT III approach, revert to CAT II minima.*

- **At 40 ft RA:**

  CHECK that FLARE is displayed on the FMA.

- **At approximately 30 ft RA:**

  CHECK that THR IDLE is displayed on the FMA, and that autothrust starts to reduce thrust toward IDLE.

- **At 10 ft, "RETARD" callout comes up:**

  MOVE the thrust levers to IDLE.

  L2 *Autothrust disconnects.*

- L1 **At touchdown:**

  CHECK that ROLL OUT appears on the FMA.

  Note: *In the case of tailwind during an automatic rollout, it is recommended to use manual braking without delay or automatic braking for an optimized runway centerline tracking.*

- **At the end of the Rollout:**

  Disconnect the autopilot.

  L2 *If the flight crew does not disconnect the AP at the end of the rollout, and uses the nosewheel steering handwheel to taxi the aircraft off the runway, the following will occur:*
  - *The AP will try to steer the aircraft back to the runway centerline, if the nosewheel steering handwheel is released and the aircraft heading is less than 20 ° off the runway centerline*
  - *The AP will automatically disconnect, if the aircraft heading is 20 ° or more off the runway centerline.*

Applicable to: ALL

MANUAL LANDING

- **At DH:**

  DISCONNECT the APs. SPEED mode remains engaged.

- **At 20 ft "RETARD" automatic call out comes up:**

  MOVE the thrust levers to IDLE if they are not there already. (The A/THR disconnects).

- **At touch down:**

  “ROLL OUT” appears on the FMA and the yaw bar comes up on the PFD.

  Note: The retard call out is only a reminder when a manual landing is performed.

EARLY SELECTION OF APPROACH MODE LOC-G/S

Pressing the APPR pushbutton arms LOC and G/S.
When the aircraft is above 5 000 ft AGL, the Radio altimeter signals may not be valid. As long as the Radio altimeter signals are invalid, the FMA displays CAT 1.

- **When the aircraft is cleared for an ILS/MLS ◁ /GLS ◁ approach:**
  PRESS the APPR pb on the FCU.
- **When the aircraft is below 5 000 ft AGL:**
  Check that the FMA displays the correct capability for the intended approach.

Applicable to: ALL

G/S (F-G/S) INTERCEPTION FROM ABOVE

If the aircraft is above the glideslope, the system will not capture the G/S (F-G/S) automatically.
The pilot must bring the aircraft onto the glideslope beam, and select an appropriate V/S to intercept it:

- For approach using ILS, *Refer to PRO-NOR-SOP-18-C Approach using LOC G/S Guidance - Glide Interception from Above*
- For approach using FLS , *Refer to PRO-NOR-SOP-18-C Approach using F-LOC F-G/S Guidance - F-G/S Beam Interception From Above*

DATA LOCK

When the aircraft reaches 700 ft RA with APPR mode (LOC and G/S) armed or engaged, the ILS FREQ and course are frozen in the receiver.
This function (ILS tune inhibit) is available, when at least one AP/FD is engaged. Any attempt to change the ILS frequency or CRS, via the MCDU or RMP, does not affect the receiver.
If the speed is managed, the system does not accept any modifications the pilot may enter on the PERF APPR page (surface wind, selected landing configuration, or VAPP) for speed guidance purposes below this altitude.
When the aircraft reaches 400 ft RA, LAND mode engages. The flight crew can only disengage this mode by engaging the GO AROUND mode.

USE OF RMPS FOR ILS/DME

If both FMGCs fail, the flight crew can use the RMPs (Radio Management Panels 1 and 2) for back up tuning. Either RMP controls ILS. Prior to select an ILS frequency on one of the RMPs, the flight crew has to select “NAV” button from RMP 1 and RMP 2.
If the ILS has a DME, the PFD will not display the DME distance. In this situation, the flight crew will fly without DME information. If necessary, increase the Decision height (DH) accordingly.

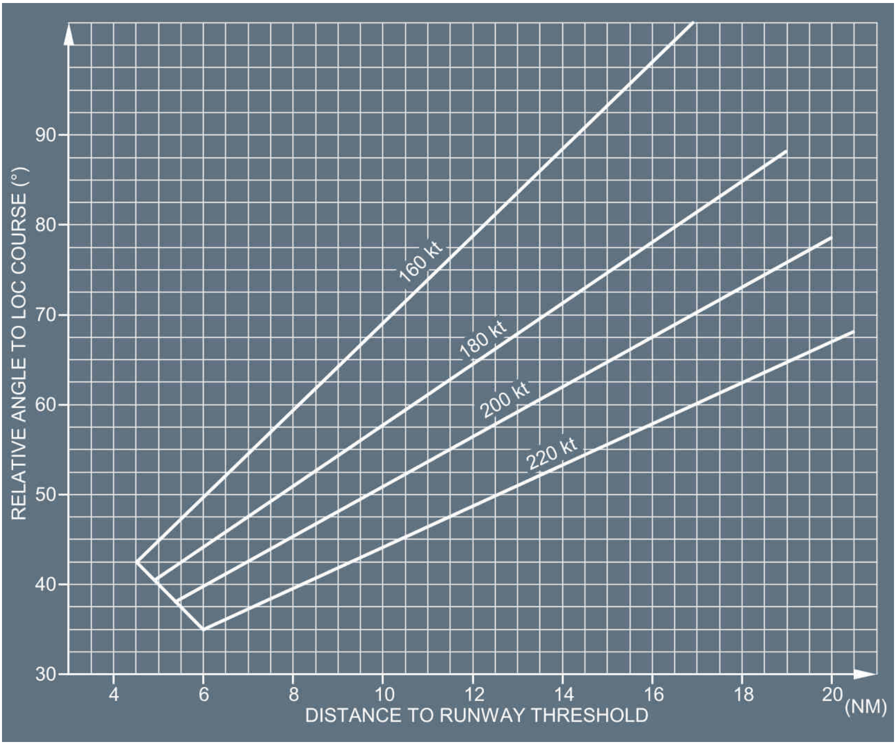
LOCALIZER (LOC) BEAM CAPTURE

The flight crew must always monitor the capture of a LOC beam. During this evolution, the PFD and ND must indicate that associated deviation indications move toward the centre of the scale.
To avoid performing a false capture, the flight crew must be careful not to arm the LOC too early.
The following graph shows the angle of interception versus distance to the runway threshold that ensures that the aircraft will not overshoot the axis by more than one and a half dot.



The capture begins when the deviation is two dots or less. It is programmed to line the aircraft up on the beam with a single overshoot, even if the intercept angle is large.

Note: *ICAO requires LOC beam to ensure a normal capture within 10 NM and plus or minus 35 ° from the course centerline. Some ILS systems just meet the requirement and are subject to false capture outside these limits.*

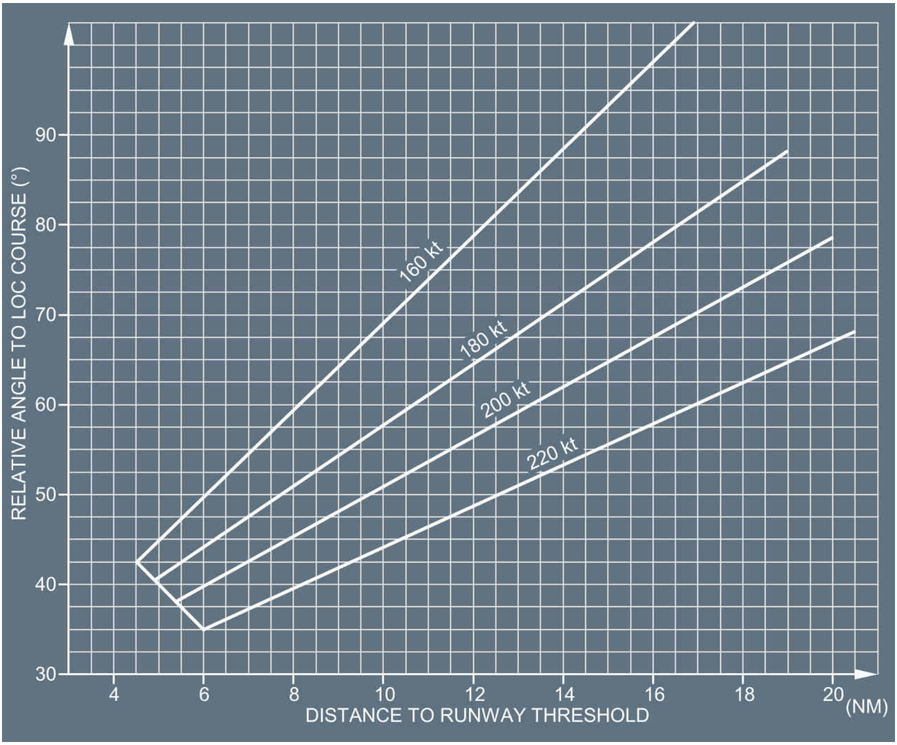
To avoid performing a false capture, the flight crew must be careful not to arm the LOC too early. The following graph shows the angle of interception versus distance to the runway threshold that ensures that the aircraft will not overshoot the axis by more than one and a half dot.



The capture begins when the deviation is two dots or less. It is programmed to line the aircraft up on the beam with a single overshoot, even if the intercept angle is large.

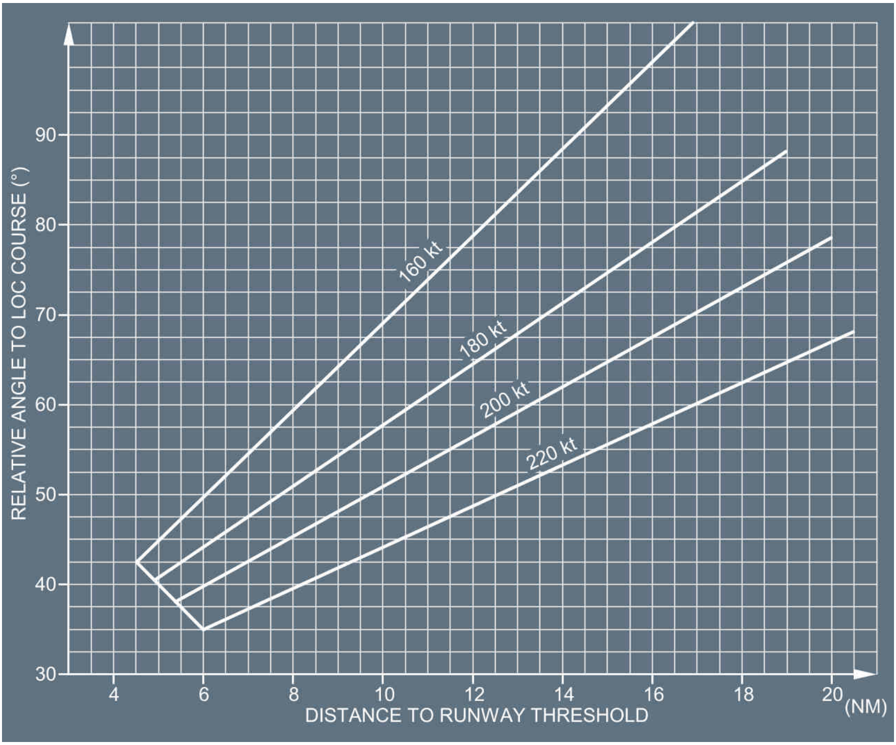
Note: 1. *ICAO requires LOC beam to ensure a normal capture within 10 NM and plus or minus 35 ° from the course centerline. Some ILS/GLS systems just satisfy the requirement and are subject to false capture outside these limits.*
2. *This diagram is based on an average ILS/GLS sensitivity, i.e. on an average distance between the runway threshold and LOC transmitter.*

11 Ident.: PRO-NOR-SRP-01-70-A-00004027.0003001 / 22 MAY 12
Applicable to: MSN 11531

LOCALIZER (LOC) OR F-LOC BEAM CAPTURE

The flight crew must always monitor the capture of a LOC or F-LOC beam. During this evolution, the PFD and ND must indicate that associated deviation indications move toward the centre of the

scale. To avoid performing a false capture, the flight crew must be careful not to arm the LOC or F-LOC too early.
The following graph shows the angle of interception versus distance to the runway threshold that ensures that the aircraft will not overshoot the axis by more than one and a half dot.



The capture begins when the deviation is two dots or less. It is programmed to line the aircraft up on the beam with a single overshoot, even if the intercept angle is large.

SWITCHING FROM NON ILS TO ILS APPROACH

Ident.: PRO-NOR-SRP-01-70-00004028.0002001 / 03 NOV 21

12 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**

If an ILS approach is possible when a non ILS was previously scheduled, use one of the following procedures:

USE OF SECOND FLIGHT PLAN

Use a secondary flight plan to prepare the alternate ILS approach, time permitting.

COPY the ACTIVE flight plan.
REVISE the ARRIVAL: insert the ILS approach and the applicable STAR/VIA.
On the RAD NAV page, TUNE in the ILS manually.
REVISE the PERF APPR page.

CHANGE OF THE CLEARANCE

ATC changes the clearance from the non-ILS to the ILS approach.

- **If a secondary flight plan has been prepared:**
  ACTIVATE the SEC F-PLN and adjust.
  Follow subsequent standard procedures.
- **If a secondary flight plan has not been prepared:**
  REVISE the ARRIVAL on the primary F-PLN, inserting the ILS approach.
  REVISE the PERF APPR page.
  Follow subsequent standard procedures.

CAUTION

If the flight crew decides to fly the ILS approach without revising the arrival of the primary flight plan (a non ILS approach is in the F-PLN), LOC and G/S modes will not be available when the flight crew presses the APPR pushbutton.

Consequently, the flight crew should:
- Manually TUNE in the ILS on the RAD NAV page: CHECK that the "CHECK APPR SELECTION" message comes up.
- Press the ILS pushbutton and select ROSE ILS on the EIS CONTROL panel.
- Use HDG, V/S or TRK, FPA modes to fly the ILS.

SWITCHING FROM NON PRECISION TO ILS/GLS/SLS ◁ APPROACH

Ident.: PRO-NOR-SRP-01-70-00004028.0016001 / 12 MAY 22
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

If an ILS / GLS / LPV (SLS ◁) approach is possible whereas another approach was previously scheduled, use one of the following procedures:

USE OF SECOND FLIGHT PLAN

Use a secondary flight plan to prepare the alternate ILS / GLS / LPV (SLS ◁) approach, time permitting.

COPY the ACTIVE flight plan.
REVISE the ARRIVAL: insert the ILS / GLS / LPV (SLS ◁) approach and the applicable STAR/VIA.
On the RAD NAV page, TUNE in the ILS / GLS manually. A manual tuning of the LPV (SLS ◁) approach on the RAD NAV page is not possible.
REVISE the PERF APPR page.

CHANGE OF THE CLEARANCE

ATC changes the clearance from the initial approach to the ILS / GLS / LPV (SLS ◁) approach.

- **If a secondary flight plan has been prepared:**

  ACTIVATE the SEC F-PLN and adjust.

  Follow subsequent standard procedures.

- **If a secondary flight plan has not been prepared:**

  REVISE the ARRIVAL on the primary F-PLN, inserting the ILS / GLS / LPV (SLS ◁) approach.

  REVISE the PERF APPR page.

  Follow subsequent standard procedures.

  Note: *If the flight crew decides to fly the ILS / GLS / LPV (SLS ◁) approach without revising the arrival of the primary flight plan (a non-precision approach is in the F-PLN), LOC and G/S modes will be available when the flight crew presses the APPR pushbutton.*

SWITCHING FROM GLS/SLS ◁ TO ILS APPROACH

Ident.: PRO-NOR-SRP-01-70-00013072.0016001 / 12 MAY 22
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

If the flight crew decides to fly an ILS approach whereas the aircraft already flies a GLS/ SLS ◁ approach in that is part of the F-PLN, use the following procedures:

PRESS the APPR pb on FCU. The system reverts to basic modes (HDG V/S, TRK FPA). Continue to follow, in selected modes, the path of the initial GLS/ SLS ◁ approach when the ILS approach is not yet activated.

ACTIVATE the SEC F-PLN if previously prepared with the alternate ILS approach or REVISE the ARRIVAL on the primary F-PLN inserting the ILS approach.

Note: *A manual tuning of the ILS through the RAD NAV MCDU page is also possible.*

Refer to procedures described in Refer to SWITCHING FROM NON ILS/NON GLS TO ILS/GLS APPROACH.

PRESS the APPR pb on FCU.

This will arm the LOC and G/S modes again.

LANDING CATEGORIES

Ident.: PRO-NOR-SRP-01-70-00004038.0001001 / 16 NOV 11

13 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11522, 11572-11597**

Each FMGC computes its own landing category : CAT1, CAT2, CAT3 single, and CAT3 dual and displays the corresponding landing category on the FMAs.
Each category depends upon the availability of aircraft systems and functions.
When the landing capability downgrades, a triple click aural warning is activated.

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic system allows the aircraft to complete the approach, flare, and landing. A CAT 3 DUAL system is a fail-operational automatic landing system.

Note: *In the event of a failure, the automatic landing system operates as a fail-passive system.*

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition or deviation of flight path or attitude, but the landing is not completed automatically. A CAT3 single system is a fail-passive automatic landing system.

Note: *With a fail-passive automatic landing system the pilot assumes control of the aircraft after a failure.*

Below 100 ft (radio altimeter), the FMGS freezes the landing capability until LAND mode is disengaged or both APs are off.
Therefore a failure occurring below 100 ft does not change the category of the system.

ALERT HEIGHT

The alert height is the height above touch down, above which a CAT3 autoland would be discontinued and a missed approach executed, if a failure occurred in either the airplane systems or the relevant ground equipments.

Below the alert height, if such a failure occurs, the flare, touchdown and roll out may be accomplished using the remaining automatic system.

LANDING CAPABILITIES

14 Ident.: PRO-NOR-SRP-01-70-00004038.0002001 / 12 MAY 22
Applicable to: MSN 11531

Each FMGC computes its own landing CAPABILITY:
- For ILS : CAT1, CAT2, CAT3 single, and CAT3 dual
- For FLS : F-APP, F-APP + RAW and RAW ONLY
- For SLS : APPR1

Each FMGS then displays the corresponding landing CAPABILITY on the FMAs.
Each capability depends upon the availability of aircraft systems and functions.
When the landing capability downgrades, a triple click aural warning is activated.

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic system allows the aircraft to complete the approach, flare, and landing. A CAT 3 DUAL system is a fail-operational automatic landing system.

Note: *In the event of a failure, the automatic landing system operates as a fail-passive system.*

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition or deviation of flight path or attitude, but the landing is not completed automatically. A CAT3 single system is a fail-passive automatic landing system.

Note: *With a fail-passive automatic landing system the pilot assumes control of the aircraft after a failure.*

Below 100 ft (radio altimeter), the FMGS freezes the landing capability until LAND mode is disengaged or both APs are off.
Therefore a failure occurring below 100 ft does not change the category of the system.

ALERT HEIGHT

The alert height is the height above touch down, above which a CAT3 autoland would be discontinued and a missed approach executed, if a failure occurred in either the airplane systems or the relevant ground equipments.
Below the alert height, if such a failure occurs, the flare, touchdown and roll out may be accomplished using the remaining automatic system.

LANDING CATEGORIES

Ident.: PRO-NOR-SRP-01-70-00004038.0003001 / 06 SEP 22

Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

Each FMGC computes its own landing category:
- For ILS: CAT1, CAT2, CAT3 SINGLE, and CAT3 DUAL
- For GLS: CAT1, and AUTO LAND.

Each FMGC then displays the corresponding landing category on the FMAs.
Each category depends upon the availability of aircraft systems and functions.
When the landing capability downgrades, a triple click aural warning is activated.

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic system allows the aircraft to complete the approach, flare, and landing. A CAT3 DUAL system is a fail-operational automatic landing system.

Note: *In the event of a failure, the automatic landing system operates as a fail-passive system.*

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition or deviation of flight path or attitude, but the landing is not completed automatically. A CAT3 SINGLE system is a fail-passive automatic landing system.

Note: *With a fail-passive automatic landing system the pilot assumes control of the aircraft after a failure.*

Below 100 ft (radio altimeter), the FMGS freezes the landing capability until LAND mode is disengaged or both APs are off.
Therefore a failure occurring below 100 ft does not change the category of the system.

ALERT HEIGHT

The alert height is the height above touch down, above which a CAT3 autoland would be discontinued and a missed approach executed, if a failure occurred in either the airplane systems or the relevant ground equipments.
Below the alert height, if such a failure occurs, the flare, touchdown and roll out may be accomplished using the remaining automatic system.

WARNINGS FOR ILS/GLS APPROACH

Ident.: PRO-NOR-SRP-01-70-00004039.0011001 / 18 MAY 22
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

AUTOLAND WARNING

For more information on conditions triggering AUTOLAND warning, *Refer to DSC-22_30-80-10 Autoland Warning Light*.

WARNING OF EXCESSIVE BEAM DEVIATION

This warning is a flashing of the LOC and G/S scales on the PFD and ND (ROSE LS mode). It occurs whenever:
- G/S deviation is more than 1 dot (above 100 ft RA)
- LOC deviation is more than 1/4 dot (above 15 ft RA).

WARNING ASSOCIATED WITH ILS/GLS "LANDING CAPABILITY"

Any downgrading in the aircraft’s capability for automatic approach and landing sounds a triple-click aural warning.

FAILURE OF BOTH LOCALIZER AND GLIDESLOPE RECEIVERS

The PFD and ND (ROSE LS mode) display LOC and G/S flags (if the LS pb has been pressed green). LOC and G/S scales disappear from the PFD.

If LOC or G/S modes are engaged and at least one AP/FD is engaged:
- The AP disengages
- The FD reverts to its HDG-V/S or TRK-FPA modes.

FAILURE OF LOCALIZER OR GLIDESLOPE TRANSMITTER (WHEN CAPTURED)

- The corresponding index is lost
- The LOC and G/S scales flash
- The corresponding FD bar flashes.

Above 200 ft RA, if the transmitter failure lasts less than 7 s, the FMA retains the LOC and G/S modes (or the LAND mode) and the APs are able to regain these modes. If the failure lasts longer than 7 s, the AP disengages and the FD reverts to its basic modes. Below 200 ft RA, if the transmitter failure occurs, the AUTOLAND warning appears, indicating that the crew must perform a go-around (if insufficient visual references) with one or two APs engaged.

AUTOLAND WARNING

For more information on conditions triggering AUTOLAND warning, *Refer to DSC-22_30-80-10 Autoland Warning Light*.

WARNING OF EXCESSIVE BEAM DEVIATION

The LOC and G/S scales flash on the PFD and ND (ROSE ILS mode). It occurs whenever:
- G/S deviation is more than 1 dot (above 100 ft RA)
- LOC deviation is more than 1/4 dot (above 15 ft RA).

WARNING ASSOCIATED WITH ILS "LANDING CAPABILITY"

Any downgrading in the aircraft's capability for automatic approach and landing sounds a triple-click aural warning.

FAILURE OF BOTH LOCALIZER AND GLIDESLOPE RECEIVERS

The PFD and ND (ROSE ILS mode) display LOC and G/S flags (if the ILS pb has been pressed green). LOC and G/S scales disappear from the PFD.

If LOC or G/S modes are engaged and at least one AP/FD is engaged:
- The AP disengages
- The FD reverts to its HDG-V/S or TRK-FPA modes.

FAILURE OF LOCALIZER OR GLIDESLOPE TRANSMITTER (WHEN CAPTURED)

- The corresponding index is lost
- The LOC and G/S scales flash
- The corresponding FD bar flashes.

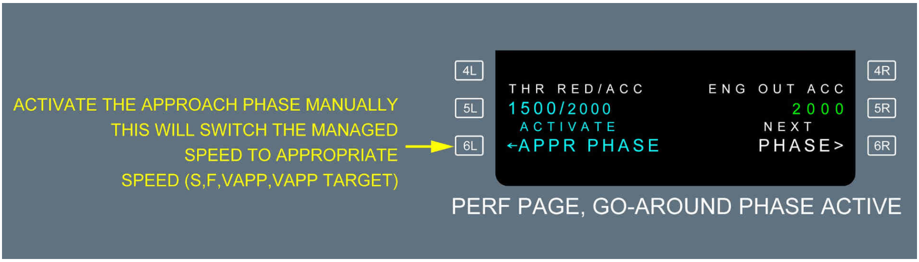
Above 200 ft RA, if the transmitter failure lasts less than 7 s, the FMA retains the LOC and G/S modes (or the LAND mode) and the APs are able to regain these modes. If the failure lasts longer than 7 s, the AP disengages and the FD reverts to its basic modes. Below 200 ft RA, if the transmitter failure occurs, the AUTOLAND warning appears, indicating that the crew must perform a go-around (if insufficient visual references) with one or two APs engaged.

Go-Around

MONITORING THE GO-AROUND

1 Ident.: PRO-NOR-SRP-01-80-00004054.0008001 / 04 SEP 18
Applicable to: MSN 11531

Engage the GO-AROUND phase and GO-AROUND modes by setting the thrust levers to the TOGA position, if at least CONF1 is selected.
When the GO-AROUND phase is engaged, the previously-flown approach is automatically strung back into the flight plan at the end of the missed approach procedure.
In the GO-AROUND phase, the system makes no predictions. Consequently, CLB and DES modes are not available, and the flight crew must monitor constraints.
When the aircraft leaves the GO-AROUND phase, all predictions and modes become available again. During a GO-AROUND phase, the managed speed is Green Dot.



ACTIVATE THE APPROACH PHASE MANUALLY

HEADING/TRACK PRESET FUNCTION IN GO-AROUND PHASE

The flight crew can use the heading/track preset, when LOC*, LOC, F-LOC*, F-LOC, FINAL, LAND or GA is engaged.

SET the appropriate heading, or track value, in the window of the FCU.
When necessary, PULL the HDG/TRK selection knob to engage the mode on the preset value.

Note: *The heading/track preset is not available in non precision approach in AP/FD FINAL mode.*

MONITORING THE GO-AROUND

Ident.: PRO-NOR-SRP-01-80-00004054.0005001 / 09 JUL 13
2 **Applicable to: MSN 01376-01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

Engage the GO-AROUND phase and GO-AROUND modes by setting the thrust levers to the TOGA position, if at least CONF1 is selected.

** - If below 100 ft RA, GA TRK, or HDG mode engages. NAV mode is armed.
- NAV mode engages when the aircraft is above 100 ft RA, and within the capture zone for the active flight plan leg and no HDG/TRK is preset.

MISSED APPROACH: TRY AGAIN

Ident.: PRO-NOR-SRP-01-80-00004057.0001001 / 14 FEB 11

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

If the pilot intends to fly another approach to the destination:
- The flight plan has all the necessary data for the missed approach
- Green Dot is the target speed.

- **When cleared by the ATC to follow the missed approach procedure:**
  ENGAGE NAV mode, or
  TURN and PULL the HDG selector knob to set a heading

  HDG, or TRK, or NAV modes can only be engaged above 100 ft.

- **When entering the initial approach area:**

  Activate the approach phase on the MCDU's PERF GO AROUND page

  - **If the APPR phase is not activated:**

    - Managed approach speed will not be available
    - The system will not furnish predictions
    - MDA/MDH/DH displays will not appear on the PFD.

MISSED APPROACH: TRY AGAIN

Ident.: PRO-NOR-SRP-01-80-00004057.0008001 / 14 FEB 11

5 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

If the pilot intends to fly another approach to the destination:

- The flight plan has all the necessary data for the missed approach
- Green Dot is the target speed.

- **When cleared by the ATC to follow the missed approach procedure:**
  ENGAGE NAV mode, or
  TURN and PULL the HDG selector knob to set a heading

  HDG, or TRK, or NAV modes can only be engaged above 100 ft.

- **When entering the initial approach area:**

  Activate the approach phase on the MCDU's PERF GO AROUND page

  - **If the APPR phase is not activated:**

    - Managed approach speed will not be available
    - The system will not furnish predictions
    - BARO/RADIO minima displays will not appear on the PFD.

MISSED APPROACH: DIVERT

Ident.: PRO-NOR-SRP-01-80-00004058.0005001 / 10 MAY 21

6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

- **If the flight crew decides to divert to the alternate:**
  ENABLE ALTN, preferably at the TO waypoint.

- **When cleared to a waypoint:**
  Perform a DIRECT TO.

The system reverts automatically to CLB phase and modifies the target speed from Green Dot to initial speed.
The system automatically sets the CRZ FL to the defaulted alternate CRZ and retains the previous cost index.
The flight crew may adjust these as necessary.

Note: *Diversion may also be initiated by entering a NEW DEST in the LAT REV page at the TO waypoint or using the secondary F-PLN if prepared (Refer to DSC-22_20-60-30 General).*

MISSED APPROACH: DIVERT

Ident.: PRO-NOR-SRP-01-80-00004058.0004001 / 10 MAY 21

ETOPS CRITICAL FUEL RESERVES

Ident.: PRO-SPO-40-30-00023321.0001001 / 03 NOV 21
Applicable to: ALL

ICING

The most critical scenario must be compensated for the greater of:

A. The effect of airframe icing during 10 % of the time during icing is forecast, including ice accumulation on unprotected surfaces, and the fuel used by engine and wing anti-ice during this period.

B. Fuel for engine and wing anti-ice for the entire time during which icing is forecast.

Note: *The ETOPS icing fuel reserve is always limited by (B).*

Unless a reliable icing forecast is available, icing may be presumed to occur when the Total Air Temperature is less than +10 °C (50 °F), or if the outside air temperature is between 0 °C (32 °F) and -20 °C (-4 °F) with a relative humidity of 55 % or more.

APU

Fuel consumption of 80 kg/h or 176 lb/h (APU GEN ON, APU BLEED OFF).
In view of our experience, Airbus recommends that the operator includes a contingency fuel provision from departure to the Critical Point, when computing the ETOPS critical fuel planning.

Intentionally left blank

DIVERSION DECISION MAKING

Ident.: PRO-SPO-40-40-00023322.0001001 / 03 NOV 22
Applicable to: ALL

The technical criteria governing a re-routing or diversion decision can be classified into four categories, as follows:
- Loss of NAT-HLA capability, before entering the NAT-HLA area (as applicable)
- Weather minima at diversion airport(s) going below the company/crew en-route minima, before reaching the ETOPS Entry Point, or diversion airport(s) becoming unsuitable for any reason
- Failure cases requiring a diversion to the nearest airport (cases leading to a LAND ASAP message on the ECAM and/or in the QRH)
- Failure cases resulting in increased fuel consumption, exceeding the available fuel reserves.

Comments and Recommendations

- Electrical generation

  If one IDG fails, a diversion is required in the case of:
  - Blue hydraulic circuit low level, low pressure or overheat, or
  - APU no start, or
  - APU or APU generator inoperative, or
  - Second IDG failure.

- Fuel system
  Some failure cases may lead to fuel gravity feeding which implies flight at lower altitude or to some fuel being unusable. The flight crew's evaluation of the actual situation and the fuel remaining may lead to the decision that a diversion is required.
- Hydraulic system:

  If there is low level, low pressure or overheat on blue hydraulic circuit, a diversion is required in the case of:
  - One IDG failure, or
  - APU no start, or
  - APU/APU GEN failure.

- APU :

  If APU/APU GEN fails, a diversion is required in the case of:
  - Blue hydraulic circuit low level, low pressure or overheat, or
  - One IDG failure.

Intentionally left blank

GENERAL

Ident.: PRO-SPO-40-50-00002051.0001001 / 26 JUN 17
Applicable to: ALL

For ETOPS flights, the flight crew must apply the below procedures, in addition to the SOP (refer to chapter PRO-NOR-SOP) and the ABNORMAL and EMERGENCY procedures (refer to chapter PRO-ABN).

NORMAL PROCEDURES

Applicable to: ALL

Ident.: PRO-SPO-40-50-A-00021794.0002001 / 26 JUN 17

COCKPIT PREPARATION

FUEL

Before each ETOPS flight, the flight crew must check that the fuel crossfeed valve is operating correctly :

FUEL X FEED .... ON

On the ECAM FUEL page, check that the fuel crossfeed valve is open (indication is inline green).

FUEL X FEED.. OFF

Check that the fuel crossfeed valve is closed.

ABNORMAL AND EMERGENCY PROCEDURES

Ident.: PRO-SPO-40-50-00002053.0006001 / 05 JUN 18
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pb is at ON).

WING ANTI-ICE

If only one ENG BLEED is available, PACK 1 must be switched OFF, to avoid having both packs and wing anti-ice supplied by a single bleed source.

ENGINE

As the engines are in degraded N1 mode, the power setting has to be done using tables given in *Refer to EFB-THR-N1 N1 MODE THRUST CONTROL*and following.

BLUE HYDRAULIC CIRCUIT LOW LEVEL OR LOW PRESSURE OR OVERHEAT

Start the APU to ensure availability of the APU generator.

ENGINE OR IDG FAILURE

Start the APU and use the APU electrical channel.

LOSS OF AIR CONDITIONING

In the case of loss of the air conditioning capability (loss of both packs, loss of both bleeds without APU bleed etc.), when at FL 100 with the RAM AIR opened, the CAB FANS must be switched off.

ABNORMAL AND EMERGENCY PROCEDURES

Ident.: PRO-SPO-40-50-00002053.0004001 / 05 JUN 18

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pb is at ON).

WING ANTI-ICE

If only one ENG BLEED is available, PACK 1 must be switched OFF, to avoid having both packs and wing anti-ice supplied by a single bleed source.

BLUE HYDRAULIC CIRCUIT LOW LEVEL OR LOW PRESSURE OR OVERHEAT

Start the APU to ensure availability of the APU generator.

ENGINE OR IDG FAILURE

Start the APU and use the APU electrical channel.

LOSS OF AIR CONDITIONING

In the case of loss of the air conditioning capability (loss of both packs, loss of both bleeds without APU bleed etc.), when at FL 100 with the RAM AIR opened, the CAB FANS must be switched off.

ABNORMAL AND EMERGENCY PROCEDURES

Ident.: PRO-SPO-40-50-00002053.0011001 / 21 MAR 17

1 **Applicable to: MSN 08495-09324, 10949-11597**

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pb is at ON).

WING ANTI-ICE

If only one ENG BLEED is available, PACK 1 must be switched OFF, to avoid having both packs and wing anti-ice supplied by a single bleed source.

BLUE HYDRAULIC CIRCUIT LOW LEVEL OR LOW PRESSURE OR OVERHEAT

Start the APU to ensure availability of the APU generator.

ENGINE OR IDG FAILURE

Start the APU and use the APU electrical channel.

LOSS OF AIR CONDITIONING

In the case of loss of the air conditioning capability (loss of both packs, loss of both bleeds without APU bleed etc.), when at FL 100 with the RAM AIR opened, the CAB FANS must be switched off.

ABNORMAL AND EMERGENCY PROCEDURES

Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

ELECTRICAL EMERGENCY CONFIGURATION

The flight crew must complete the ECAM procedure using the following:

AIR CONDITIONING

As cockpit and cabin temperature control is lost, it is recommended to open the cockpit door.

PRESSURIZATION

If one engine (or one bleed system) is failed, forward cargo ventilation must be closed to avoid CAB PR EXCESS CAB ALT from being triggered on the ECAM during descent or cruise.

FUEL

As all fuel pumps are lost, the engines are fed by gravity. *Refer to GRVTY FUEL FEEDING Procedure*.

ENGINE ANTI-ICE

Engine anti-ice valves are permanently open, although the ECAM memo ENG A. ICE is not displayed on the ECAM (except if the ENG A. ICE pushbutton is at ON).

WING ANTI-ICE

If only one ENG BLEED is available, PACK 1 must be switched OFF, to avoid having both packs and wing anti-ice supplied by a single bleed source.

BLUE HYDRAULIC CIRCUIT LOW LEVEL OR LOW PRESSURE OR OVERHEAT

Start the APU to ensure availability of the APU generator.

ENGINE OR IDG FAILURE

Start the APU and use the APU electrical channel.

LOSS OF AIR CONDITIONING

In the case of loss of the air conditioning capability (loss of both packs, loss of both bleeds without APU bleed etc.), when at FL 100 with the RAM AIR opened, the CAB FANS must be switched off.

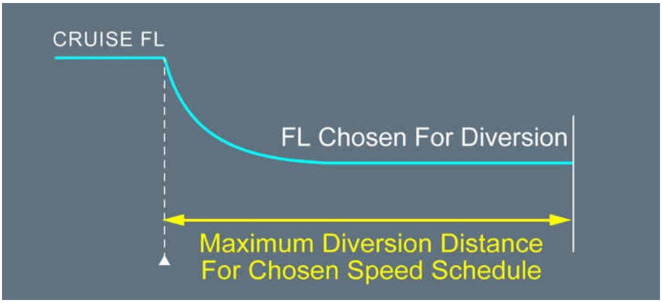
MAXIMUM DIVERSION DISTANCE

Ident.: PRO-SPO-40-60-00023324.0098001 / 17 NOV 20
Applicable to: MSN 05528, 05947-05987, 06097, 06121, 06163-06165



The following computation takes into account the below conditions:

- ISA conditions
- No wind
- Optimum diversion level after engine failure
- Single engine diversion speed schedule.

Note: Obstacles have not to be considered to determine if a route is or is not an ETOPS route.

MAXIMUM DIVERSION DISTANCE

MAXIMUM DIVERSION DISTANCE

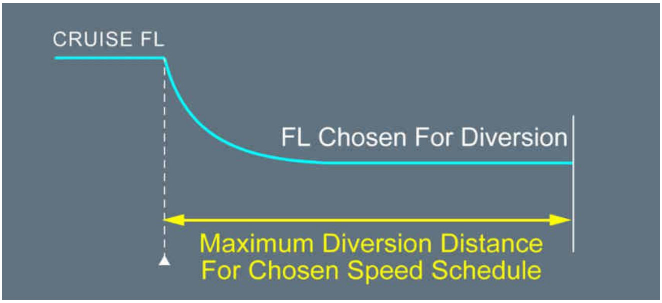
Ident.: PRO-SPO-40-60-00023324.0005001 / 17 NOV 20
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 04441-04544, 04827-04974, 05066, 05101-05240



The following computation takes into account the below conditions:
- ISA conditions
- No wind
- Optimum diversion level after engine failure
- Single engine diversion speed schedule.

Note: *Obstacles have not to be considered to determine if a route is or is not an ETOPS route.*

MAXIMUM DIVERSION DISTANCE							
SPEED SCHEDULE	**A/C WEIGHT AT CRITICAL POINT (KG)**	**FL FOR DIVERSION**	**DIVERSION TIME (MIN)**

ENGINE INTERMIX TYPE 1

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

Ident.: PRO-SPO-45-A-00002059.0001001 / 30 JUN 14

The following information provides the conditions and procedures necessary in order to temporarily operate an A318/A319/A320/A321 aircraft when a CFM56–5B Single Annular Combustor (SAC) engine is intermixed with a CFM56–5B Double Annular Combustor (DAC) engine.
This engine intermix configuration is indicated in the cockpit with the following placard: “CAUTION: ENGINE INTERMIX TYPE 1” or "CAUTION: ENGINE INTERMIX".

Ident.: PRO-SPO-45-A-00002060.0001001 / 07 DEC 10

ENGINE PARAMETERS

Engine parameters differ significantly, when the engines are at idle:

EGT	:	Up to 250 °C higher on the DAC engine.
FUEL FLOW	:	Up to 25 % higher on the DAC engine.
N1	:	Higher on the DAC engine.
N2	:	Lower on ground on the DAC engine; higher in flight on the DAC engine.

Ident.: PRO-SPO-45-A-00002061.0001001 / 07 DEC 10

CROSSBLEED ENG START

The DAC engine has insufficient acceleration capability to sustain idle speed with a large bleed offtake, when it operates with only 20 injectors. Therefore, it is necessary to preset a 30 % N1 on the supplying engine before launching the start sequence.

Ident.: PRO-SPO-45-A-00004068.0001001 / 07 DEC 10

TAKEOFF PROCEDURE

- The PF must progressively adjust engine thrust in two steps:
  - Step 1 : Idle to 50 % N1.
    Brakes released, when the 50 % N1 is stabilized on both engines.
  - Step 2 : Both engines N1 to takeoff thrust.

  This procedure enables a significantly slower acceleration from ground idle to N1 = 50 % for the double annular combustor.
- Other standard operating procedures apply for takeoff.

Ident.: PRO-SPO-45-A-00002062.0001001 / 07 DEC 10

ENGINE RESPONSE

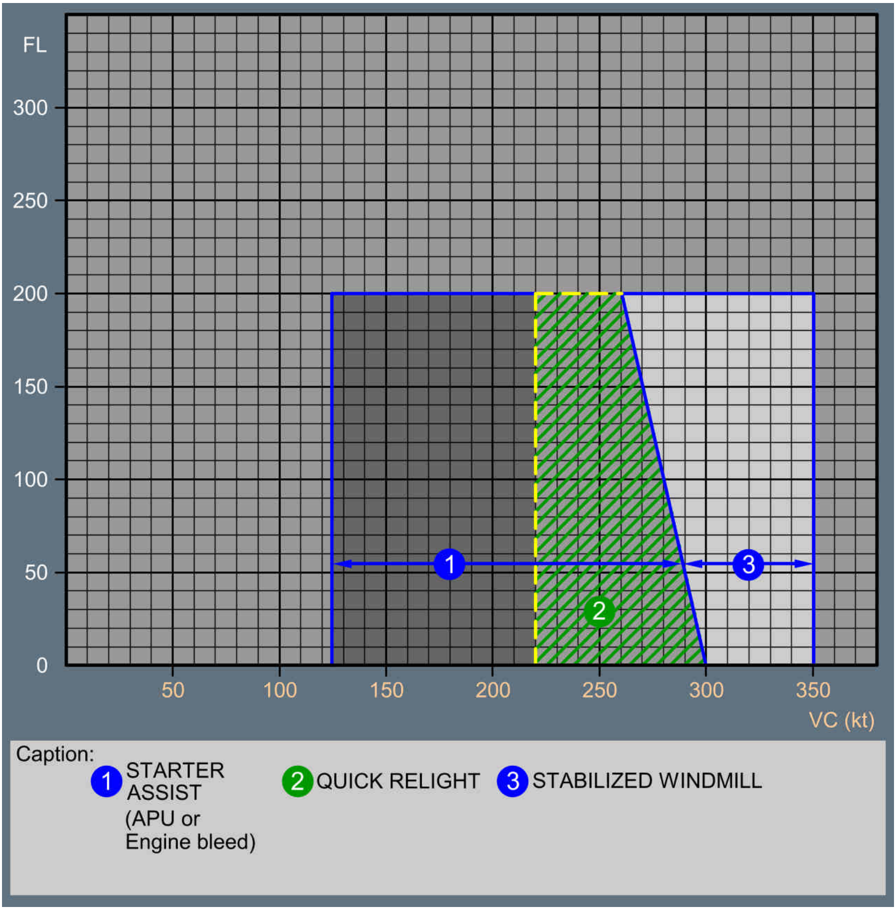
In flight, when the aircraft is in clean configuration, the DAC engine may accelerate from idle more slowly than the SAC engine. This is particularly evident, if the acceleration follows a deceleration.

There is no significant effect on aircraft handling. This difference in engine response disappears when the slats are extended.

Ident.: PRO-SPO-45-A-00004067.0001001 / 09 OCT 12

ENGINE RELIGHT

The DAC engine relight envelope is more restrictive than the SAC engine relight envelope. Therefore, in case of engine intermix, the flight crew must use the DAC engine relight procedure with the corresponding chart (See chart below).



ENGINE INTERMIX TYPE 2

Ident.: PRO-SPO-45-B-00012731.0007001 / 06 MAR 17
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

The following information provides the necessary conditions and procedures in order to temporarily operate an A318/A319/A320/A321 with engine intermix configuration between two different SAC engines among CFM56–5Bx classic, the CFM56–5Bx/P, the CFM56-5Bx/3 and the CFM56-5Bx/P “TI HPC kit”.
FADEC intermix configuration 5BM software (installed on CFM56-5B classic) with FADEC 5BR software is indicated in the cockpit with the following placard: “CAUTION: ENGINE INTERMIX TYPE 2”.

Note: *When FADEC Standard “5BR” or subsequent is installed on both engines, engine thrust behavior is harmonized (transient thrust dissymmetry no longer exist). Therefore, a placard is not necessary and is not displayed.*

Ident.: PRO-SPO-45-B-00012731.0008001 / 06 MAR 17
Applicable to: MSN 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

The following information provides the necessary conditions and procedures in order to temporarily operate an A321 with engine intermix configuration between two different SAC engines among CFM56–5Bx classic, the CFM56–5Bx/P, the CFM56-5Bx/3 and the CFM56-5Bx/P “TI HPC kit”.
FADEC intermix configuration 5BM software (installed on CFM56-5B classic) with FADEC 5BR software is indicated in the cockpit with the following placard: “CAUTION: ENGINE INTERMIX TYPE 2”.

Note: *When FADEC Standard “5BR” or subsequent is installed on both engines, engine thrust behavior is harmonized (transient thrust dissymmetry no longer exist). Therefore, a placard is not necessary and is not displayed.*

Ident.: PRO-SPO-45-B-00012732.0010001 / 24 FEB 15
Applicable to: MSN 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

ENGINE PARAMETERS

N1 : At maximum CLB thrust, a difference of up to 1.6 % N1 on the CFM56-5B3/3 TI engine may be observed above FL 200.

Ident.: PRO-SPO-45-B-00012732.0001001 / 07 DEC 10
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

ENGINE PARAMETERS

In the case of only one operative pack configuration (only one pack OFF):

- N1 : At idle up to 9 % higher on the CFM56-5B/3 TI engine, on ground or in flight in clean configuration.
- N2 : At idle up to 11 % higher on the CFM56-5B/3 TI engine, on ground or in flight in clean configuration.

Ident.: PRO-SPO-45-B-00012733.0001001 / 07 DEC 10
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

TAKEOFF PROCEDURE

In the case of only one operative pack configuration, due to the difference in N2 at idle between engines, the following takeoff procedure is recommended:

- The PF progressively adjusts engine thrust in two steps:
  - Step 1 : From idle to about 50 % N1 on brakes.
  - Step 2 : From both engines at similar N1 to takeoff thrust after brakes release.
- Other standard operative procedures apply for takeoff.

Ident.: PRO-SPO-45-B-00012734.0007001 / 14 MAY 12
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

ENGINE RESPONSE

In the case of only one operative pack configuration, due to the difference in N2 at idle between engines, the CFM56–5B/3 TI engine may accelerate from idle to high thrust faster than the CFM56–5B/P SAC engine when the aircraft is on ground or in flight in clean configuration. There is no significant effect on aircraft handling.
The difference in engine response disappears in flight when the slats are extended.

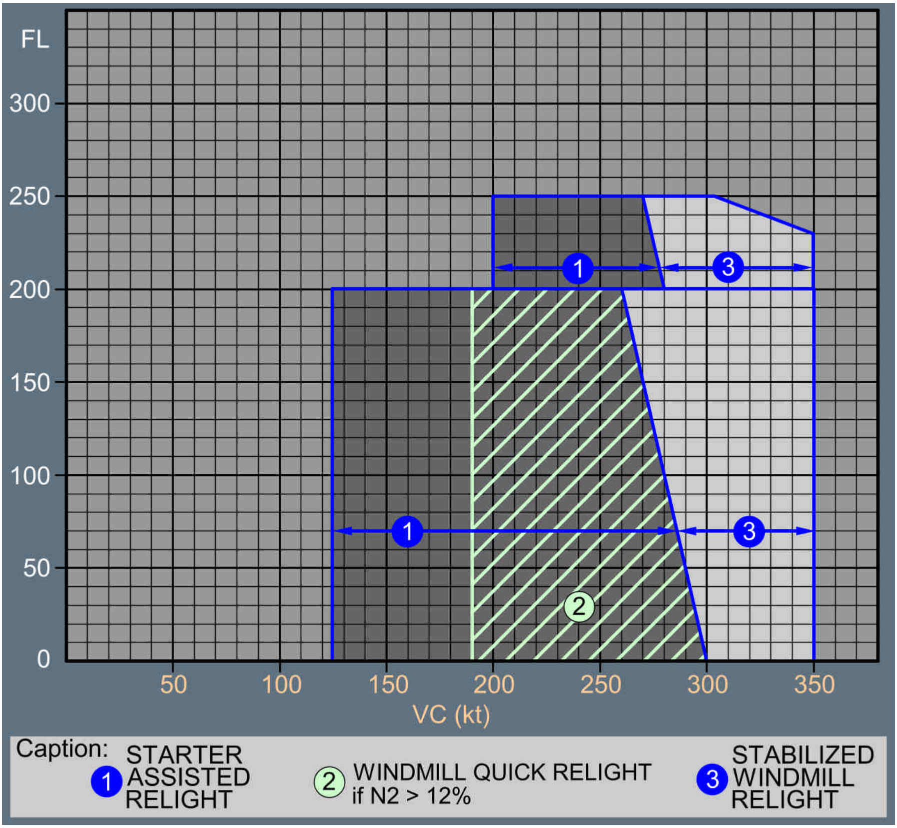
Note: *Depending on the FADEC standard, the flight crew may observe a different deceleration between the two engines (CFM56–5B/P engine is faster to decelerate) when the aircraft is above FL 100 and in unsymmetrical bleed configuration or with the APU BLEED ON.*

Ident.: PRO-SPO-45-B-00016162.0010001 / 02 MAY 17
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

ENGINE RELIGHT

For SAC-TI engine the maximum altitude for the engine relight envelope is reduced, compared with the SAC engine relight envelope. Therefore, in case of engine intermix, the flight crew must use the SAC-TI engine relight envelope below.

Engine Relight Envelope



Intentionally left blank

GENERAL

Ident.: PRO-SPO-50-00020828.0001001 / 17 MAR 17
Applicable to: ALL

The A318/A319/A320/A321 aircraft systems are designed to comply with the design criteria of the EASA and FAA regulations (documents references provided in the AFM) for the RVSM capability.
In addition, operators must obtain an operational approval from their national airworthiness authorities, in order to operate within the RVSM airspace. The EASA and FAA regulations (documents references provided in the AFM) also indicate the requirements for obtaining operational approval.

REQUIRED EQUIPMENTS/FUNCTIONS FOR RVSM

Ident.: PRO-SPO-50-00020955.0001001 / 17 MAR 17
Applicable to: MSN 01143-01251, 01459

RVSM regulations require the following equipment/functions in order to be operative :
- ADR1 + ADR2 + two DMCs
- 1 transponder
- 1 Autopilot function
- 1 FCU channel (for altitude target selection and OP CLB/OP DES mode engagement)
- 2 PFD functions (for altitude indication)
- 1 FWC (for altitude alert function).

REQUIRED EQUIPMENTS/FUNCTIONS FOR RVSM

Ident.: PRO-SPO-50-00020955.0002001 / 17 MAR 17
1 **Applicable to: MSN 01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

RVSM regulations require the following equipment/functions in order to be operative:
- 2 ADRs + 2 DMCs
- 1 transponder
- 1 Autopilot function
- 1 FCU channel (for altitude target selection and OP CLB/OP DES mode engagement)
- 2 PFD functions (for altitude indication)
- 1 FWC (for altitude alert function).

RVSM NORMAL PROCEDURE

Ident.: PRO-SPO-50-00020830.0002001 / 17 MAR 17

2 **Applicable to: MSN 01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

For flights in RVSM airspace, the flight crew must apply the standard procedures, in addition to the following RVSM procedures.

FLIGHT PREPARATION

The flight crew must take into account the conditions that may affect operations in RVSM airspace, including:

RVSM APPROVAL...CHECK

L2 *Verify that the aircraft is approved for RVSM operations.*

L1 WEATHER...CHECK

L2 *Review the weather forecasted for the flight route. If severe turbulence is expected, this may affect the ability to maintain aircraft altitude.*

L1 REQUIRED EQUIPMENT FOR RVSM...CHECK

L2 *Check that the required equipment is operative (MEL).*
The flight crew should review the maintenance logs and forms, in order to ensure that the equipment required for RVSM is satisfactory.

L1 ALTITUDES...CHECK

L2 *Check that the difference between each altitude indication (in the QNH reference) displayed on PFDs and the airport elevation is less than 75 ft.*
Check that the difference between the two primary altitude indications on the PFDs is less than the tolerance specified in SOP. Refer to PRO-NOR-SOP-06 Glareshield - EFIS Control Panel.

L1 IN FLIGHT

BEFORE ENTERING RVSM AIRSPACE

REQUIRED EQUIPMENT FOR RVSM ....OPERATIVE

L2 *If any of the required equipment fails before the aircraft enters RVSM airspace, the flight crew must request new clearance, to avoid this airspace.*

L1 ALTITUDES...CHECK

L2 *Check on the PFDs that the difference between altitude indications (in the standard baro setting) is less than the specified tolerance in the table below.*
If only two ADRs are operative, the altimeter indications on PFD and standby altimeter should be recorded. This information may be useful in case of subsequent PFD altitude discrepancy, or loss of both remaining ADRs.

L1

		Comparison of Altitude Indication (ft)		
Flight Level	**Speed or Mach Number**	**Difference between ADR1 and ADR2 (on PFDs)**	**Difference between ADR3 and ADR1/2 (on PFDs)**	**Difference between STBY ALTI and ADRs**
FL 50	250 kt	50 (15 m)	65 (20 m)	130 (40 m)
FL 100	250 kt	55 (17 m)	80 (24 m)	185 (56 m)
FL 200	300 kt	90 (27 m)	135 (41 m)	295 (90 m)
FL 300	M 0.78	130 (40 m)	195 (59 m)	390 (119 m)
FL 390	M 0.78	130 (40 m)	195 (59 m)	445 (136 m)

IN RVSM AIRSPACE

AP...KEEP ENGAGED

L2 *Ensure that autopilot is engaged for cruise, and for flight level changes.*

L1 AP GUIDANCE...MONITOR

L2 *During flight level transitions, do not exceed or go below the assigned flight level by more than 150 ft.*

L1
- **Approximately every hour:**

  ALTITUDES...CHECK

L2 *Check that the difference between the altitude indications on PFDs is less than the specified tolerance. For more information, See table in "Before Entering RVSM airspace".*
Regular check of the flight deck instruments should be sufficient.

L1 AT THE END OF THE FLIGHT

ANY MALFUNCTIONS or DEVIATIONS...REPORT

L2 *Report any malfunction of the systems that enable the aircraft to maintain altitude, including:*
- *Any malfunction or loss of required equipment*
- *Any deviation involving the functions that enable the aircraft to maintain altitude.*

RVSM ABNORMAL AND EMERGENCY PROCEDURE

Ident.: PRO-SPO-50-00020831.0001001 / 17 MAR 17
Applicable to: MSN 01143-01251, 01459

ATC....................NOTIFY

When the aircraft is in RVSM airspace, the flight crew must notify the ATC of the following situations, because they may affect the aircraft's ability to maintain the flight level:
- *The failure of both autopilots*
- *The loss of altimeter system redundancy (only one PFD indication remaining)*
- *An excessive discrepancy in altitude indications, and no way to identify the valid indication*
- *The failure of any other equipment, that affects the aircraft's ability to maintain flight level*
- *The encounter of greater than moderate turbulence*
- *Loss of ADR1 or ADR2.*
  If ADR1 fails, use the AP2.
  If ADR2 fails, use the AP1.
  If the AP is unable to maintain the assigned flight level, select the other AP.

If the flight crew cannot notify the ATC or obtain the ATC clearance before deviating from the assigned flight level, they should follow the established contingency procedure and obtain the ATC clearance as soon as possible.

RVSM ABNORMAL AND EMERGENCY PROCEDURE

Ident.: PRO-SPO-50-00020831.0002001 / 17 MAR 17

3 **Applicable to: MSN 01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

ATC...NOTIFY

When the aircraft is in RVSM airspace, the flight crew must notify the ATC of the following situations, because they may affect the aircraft's ability to maintain the flight level:

- *The failure of both autopilots*
- *The loss of altimeter system redundancy (only one PFD indication remaining)*
- *An excessive discrepancy in altitude indications, and no way to identify the valid indication*
- *The failure of any other equipment, that affects the aircraft's ability to maintain flight level*
- *The encounter of greater than moderate turbulence.*

If the flight crew cannot notify the ATC or obtain the ATC clearance before deviating from the assigned flight level, they should follow the established contingency procedure and obtain the ATC clearance as soon as possible.

GENERAL

Applicable to: ALL

Ident.: PRO-SPO-51-A-00015857.0001001 / 20 MAR 17

GENERAL

The Performance Based Navigation (PBN) concept implies that the aircraft follows the defined track with a requested navigation performance. The PBN includes RNAV and RNP operations.
For RNAV and RNP operations, an operational approval from the airline's national authorities may be required.
The AFM provides regulatory compliances associated with PBN operations.

Ident.: PRO-SPO-51-A-00015859.0001001 / 09 SEP 14

RNAV/RNP CAPABILITY

Before the aircraft enters an RNAV/RNP airspace, RNAV/RNP capability is based on:
- The required RNAV/RNP equipment that is described in each RNAV/RNP section of the FCOM
- Navigation Accuracy HIGH displayed on the MCDU PROG page
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

When the aircraft flies in RNAV/RNP airspace, RNAV/RNP capability is based on:
- Navigation Accuracy HIGH displayed on the MCDU PROG page
- Any specific local requirements published in the Aeronautical Information Publication (AIP).

RNAV 10 / RNP 10

Applicable to: ALL

Ident.: PRO-SPO-51-B-00015854.0001001 / 09 SEP 14

GENERAL

RNAV 10 operations correspond to RNP 10 operations.
In RNAV 10 airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-B-00015855.0001001 / 28 MAY 20

REQUIRED RNAV 10 EQUIPMENT

The minimum navigation equipment required to enter RNAV 10 airspace is:
- Two FMGCs (or one FMGC and one BACK UP NAV ◁✻)
- Two MCDUs
- Two IRS

- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side)
- One GPS if the flight time outside radio navaid coverage is longer than:
  - 6.2 hr from the time of IRS ground alignment, or
  - 5.7 hr from the time of the last FM position update.

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If the GPS PRIMARY LOST ◁ message is displayed on both NDs/MCDUs, RNAV 10 operations can be continued:**
  - With no time restriction if radio navaids update is available
  - For 5.7 hr from the time of the last position update if radio navaids update is not available. After 5.7 hr, the navigation accuracy must be considered LOW regardless of the navigation accuracy that is displayed on the MCDU PROG page.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page ◁ in order to identify which FMGC position is correct:**
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 10 capability is lost.

RNAV 5 / BRNAV

Applicable to: ALL

Ident.: PRO-SPO-51-C-00015851.0001001 / 20 MAR 17

GENERAL

RNAV 5 operations correspond to European BRNAV operations.

Ident.: PRO-SPO-51-C-00015852.0001001 / 28 MAY 20

REQUIRED RNAV 5 EQUIPMENT

The minimum navigation equipment required to enter RNAV 5 airspace is:
- One FMGC
- One MCDU
- One GPS or one DME receiver to update FM position
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side)
- One IRS.

Ident.: PRO-SPO-51-C-00015864.0001001 / 11 APR 17

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.

- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

  If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNAV 5 capability is lost.

RNAV 1 RNAV 2 / P-RNAV - TERMINAL RNAV

Applicable to: ALL

Ident.: PRO-SPO-51-D-00015848.0001001 / 20 MAR 17

GENERAL

RNAV 1(2) operations correspond to P-RNAV TERMINAL RNAV operations.
The AIP may specify that GPS equipment is required.

Ident.: PRO-SPO-51-D-00015849.0001001 / 28 MAY 20

REQUIRED RNAV 1(2) EQUIPMENT

The minimum navigation equipment required to enter RNAV1/RNAV2 airspace is:

- One FMGC
- One MCDU
- One GPS or one DME receiver to update the FM position
- Two IRS
- One FD in NAV mode
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-D-00015865.0001001 / 20 MAR 17

PROCEDURE

BEFORE ENTERING RNAV 1(2) AIRSPACE

The FMS navigation database provides the terminal procedure (RNAV SID, RNAV STAR, RNAV TRANSITION, etc.) of the flight plan. The flight crew must crosscheck the terminal procedure from the published charts with the FMS navigation database on the F-PLN page (waypoint sequences, tracks, distances, and altitude or speed constraints). The flight crew must not modify the procedure that is provided by the navigation database, unless required by the ATC (DIR TO, radar vectoring, insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNAV 1(2) capability is lost.

RNP 4

Applicable to: ALL

Ident.: PRO-SPO-51-E-00015845.0001001 / 09 SEP 14

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-E-00015846.0001001 / 28 MAY 20

REQUIRED RNP 4 EQUIPMENT

The minimum navigation equipment required to enter RNP 4 airspace is:
- Two FMGCs (or one FMGC and one BACK UP NAV ◁)
- Two MCDUs
- Two IRS
- One GPS
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-E-00015866.0001001 / 17 MAY 21

PROCEDURE

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**
  - As per design FMS REQ ACCUR is set by default; this default value (e.g. 2 NM in cruise, 1 NM in terminal area) is more restrictive than overflown airspace required navigation performance.
  - Any change on FMS REQ ACCUR to be in accordance with airspace requirement is at flight crew's discretion; and should be set back to default value when leaving intended airspace.

  If NAV ACCUR DOWNGRAD remains displayed, the flight crew should inform ATC that the RNP 4 capability is lost.

RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA

Applicable to: ALL

Ident.: PRO-SPO-51-I-00021541.0001001 / 20 MAR 17

GENERAL

In this airspace, the aircraft is expected to fly for a long period of time outside radio navaid coverage.

Ident.: PRO-SPO-51-I-00021542.0001001 / 28 MAY 20

REQUIRED RNP 2 IN OCEANIC AND REMOTE CONTINENTAL AREA EQUIPMENT

The minimum navigation equipment required to enter RNP 2 oceanic and remote continental airspace is:

- Two FMGCs (or one FMGC and one BACK UP NAV ◁)
- Two MCDUs
- Two IRS
- One GPS
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-I-00021544.0001001 / 20 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 2 in oceanic and remote continental area operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should crosscheck the position data using the POSITION MONITOR page, the IRS 1(2)(3) pages, and the GPS MONITOR page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 2 capability is lost.

RNP 2 IN DOMESTIC AREA

Applicable to: ALL

Ident.: PRO-SPO-51-J-00021545.0001001 / 28 MAY 20

REQUIRED RNP 2 IN DOMESTIC AREA EQUIPMENT

The minimum navigation equipment required to enter RNP 2 domestic airspace is:
- One FMGC
- One MCDU
- One GPS
- Two IRS
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-J-00021546.0001001 / 20 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 2 in domestic area operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.
- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 2 capability is lost.

RNP 1 / TERMINAL RNP 1- BASIC RNP 1

Applicable to: ALL

Ident.: PRO-SPO-51-F-00015842.0001001 / 20 MAR 17

GENERAL

RNP 1 operations correspond to RNP 1 Terminal operations.

Ident.: PRO-SPO-51-F-00015843.0001001 / 28 MAY 20

REQUIRED RNP 1 EQUIPMENT

The minimum navigation equipment required to enter RNP 1 airspace is:
- One FMGC
- One MCDU
- One GPS
- Two IRS
- One FD in NAV mode
- Two NDs (the temporary display of ND information via the PFD/ND sw is permitted on PM side).

Ident.: PRO-SPO-51-F-00015867.0001001 / 20 MAR 17

PROCEDURE

FLIGHT PREPARATION

RAIM/AIME availability should be confirmed for RNP 1 operations.
Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed)

BEFORE ENTERING RNP 1 AIRSPACE

The FMS navigation database provides the terminal procedure (RNAV SID, RNAV STAR, RNAV TRANSITION, etc.) of the flight plan. The flight crew must check the terminal procedure from the published charts with the FMS navigation database on the F-PLN page (waypoint sequences, tracks, distances, and altitude or speed constraints). The flight crew must not modify the procedure that is provided by the navigation database, unless required by the ATC (DIR TO, radar vectoring, insertion of waypoints from the navigation database).

MANAGEMENT OF DEGRADED NAVIGATION

- **If one of the following messages is displayed, the flight crew should resume navigation with the FMGC that provides the correct position:**
  - GPS PRIMARY LOST ◁ on one ND/MCDU
  - NAV ACCUR DOWNGRAD on one ND/MCDU.

- **If one of the following MCDU or ECAM messages is displayed, the flight crew should check the navigation accuracy with navaid raw data via the MCDU PROG page in order to identify which FMGC position is correct:**
  - GPS PRIMARY LOST ◁ on both NDs/MCDUs
  - FMS1/FMS2 POS DIFF
  - CHECK IRS 1(2)(3)/FM POSITION ◁
  - CHECK A/C POSITION ◁
  - NAV FM/GPS POS DISAGREE ◁

  The flight crew should resume navigation with the FMGC that provides the correct position.
- **If NAV ACCUR DOWNGRAD is displayed on both sides:**

  The flight crew should inform the ATC that the RNP 1 capability is lost.

RNP APCH / RNAV(GNSS)

Ident.: PRO-SPO-51-G-00015839.0001001 / 20 MAR 17
Applicable to: ALL

GENERAL

RNP APCH operations correspond to RNAV(GNSS) or RNAV(GPS) operations.

Ident.: PRO-SPO-51-G-00015840.0001001 / 11 JUL 17
Applicable to: ALL

REQUIRED RNP APCH EQUIPMENT

The minimum equipment required to start RNP APCH operations is:
- One FMGC
- One GPS
- Two IRS
- One MCDU
- One FD
- One PFD on the PF side
- Two NDs (the temporary display of ND information via the PFD/ND switch is permitted on PM side)
- Two FCU channels.

1 Ident.: PRO-SPO-51-G-00015868.0003001 / 12 MAY 22
Applicable to: MSN 11531

PROCEDURE

Refer to PRO-NOR-SOP-18-C Approach using LOC G/S Guidance - General.

Refer to PRO-NOR-SOP-18-C Approach using FINAL APP Guidance - General.
Refer to PRO-NOR-SOP-18-C Approach using F-LOC F-G/S Guidance - General.
Refer to PRO-NOR-SOP-18-C Approach using FPA Guidance - General.

Ident.: PRO-SPO-51-G-00015868.0001001 / 10 MAY 21

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

PROCEDURE

Refer to PRO-NOR-SOP-18-C Approach using FINAL APP Guidance - General.
Refer to PRO-NOR-SOP-18-C Approach using FPA Guidance - General.

RNP AR / RNAV(RNP)

Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: PRO-SPO-51-H-00012736.0002001 / 23 JUN 15

3

GENERAL

RNP AR operations correspond to RNAV(RNP) operations.
For RNP AR operations, the flight crew should refer to the specific procedures published by the airline.
The airline must obtain an operational approval and the flight crew must be qualified for this type of operations. To obtain this operational approval the airline should refer to the AFM and the associated Airworthiness Compliance Document (ACD). The approved RNP values are given in the AFM and the ACD.
The main procedure steps for RNP AR have been introduced in the Procedures of this FCOM and in the paragraph below. This does not relieve the airline from the need to provide the flight crew with tailored procedures when required.

Ident.: PRO-SPO-51-H-00012737.0003001 / 03 NOV 22

4

REQUIRED RNP AR EQUIPMENT

The minimum equipment required to start RNP AR operations is:
- 2 FMGC
- 2 MCDU
- 2 FD
- 1 AP (2 AP if RNP less than 0.3 is required or missed approach less than 1 NM)
- 2 FAC
- 2 ELAC
- 2 SFCC
- 2 RA

- 2 PFD with L/DEV and V/DEV displays
- 2 ND
- 2 GPS (MMR)
- 3 ADIRS in NAV mode
- TAWS with display of terrain
- FCU with both channels
- 1 FWC

Ident.: PRO-SPO-51-H-00014680.0002001 / 24 FEB 23

5
6

PROCEDURES

The availability of GPS PRIMARY for the estimated time of operation must be verified with an appropriate GPS prediction tool before dispatch.

Prior to starting RNP AR instrument procedures, check that:
- OAT and wind, as applicable, are within limits
- The FMS lateral and vertical F-PLN extracted from the navigation database is in accordance with the instrument procedure chart
- Two GPS sensors are in NAV or SBAS ◁ on GPS MONITOR page
- The correct RNP value is displayed on MCDU with HIGH accuracy
- GPS PRIMARY is available.

For operations with RNP < 0.3 NM, one AP must be engaged.
If obstacles, EGPWS TERRAIN display must be selected on both ND unless weather radar monitoring is required on one side.
Airspeed and configuration must be adapted for the radius of turns in the procedure.

DEPARTURE

Before takeoff, check that NAV is armed.
When NAV is indicated active on FMA and at 100 ft, select AP ON.
Monitor lateral deviation using the L/DEV on PFD.
Callout must be performed when L/DEV reaches ½ dot.
If L/DEV increases towards 1 RNP, take over manually using FD and the L/DEV indication to fly back on the intended flight plan and reengage AP as applicable.

APPROACH

Refer to FCOM-PRO-NOR-SOP-APPROACH-AIRCAFT GUIDANCE MANAGEMENT-APPR using FINAL APP for RNAV(RNP).

GO AROUND

Refer to FCOM-PRO-NOR-SOP-GO AROUND.

ABNORMAL OPERATIONS

Detailed information is provided in the ACD for the airline to develop contingency procedures adapted to each operation.
The flight crew must be trained to conduct departure or missed approach procedures with system failures to ensure a safe extraction.

ENGINE FAILURE

In the case of engine failure during departure or a missed approach procedure, the flight crew must consider the bank angle limitation when flying at a speed below the maneuvering speed. Turns in the procedure may require bank angles above 15 °. Flying with one engine inoperative affects the aircraft lateral performance. The flight crew should be trained and instructed to disconnect AP if the aircraft deviates from the intended track. This training must consider turning and straight legs as appropriate.

Intentionally left blank

GENERAL

Ident.: PRO-SPO-60-00023439.0002001 / 17 NOV 20
Applicable to: ALL

This chapter gives the limitations, procedures and performance for operations from/to runways with a width below 45 m .
This chapter does not constitute an operational approval to operate on narrow runways.
Such authorization must be obtained by the operator from the appropriate authorities.

LIMITATIONS

Ident.: PRO-SPO-60-00023440.0002001 / 15 NOV 21
Applicable to: ALL

Minimum runway width..30 m

The dispatch from/to narrow runways is not allowed in the case of:
- Nose wheel steering inoperative
- One brake or more inoperative.

Autoland is not allowed.

MAXIMUM DEMONSTRATED CROSSWIND FOR TAKEOFF AND LANDING

Runway Surface Conditions		Maximum Crosswind for Takeoff (Gust included)	Related Landing Performance		Maximum Crosswind for Landing (Gust included)
Runway State or / and Runway Contaminant	**AIREP**[1]		**RWYCC**[2]	**Level**

2 **Applicable to: MSN 10949-11522, 11572-11597**

Diversion to a 45 m wide runway is recommended in case of :
- Rudder jam
- Rudder pedal jam
- Yaw damper system fault
- Rudder Travel Limit system fault
- All failures leading to the loss of the nose wheel steering (HYD Yellow system loss, double hydraulic failure, double BSCU fault, double LGCIU fault)

Intentionally left blank

GENERAL

Ident.: PRO-SPO-62-00002095.0001001 / 22 OCT 14

1 **Applicable to: MSN 02321, 02887-02904, 04563, 05005, 05097, 08495-09324, 10949-11522, 11572-11597**

At El Salvador (SCES), the mean runway slope is 3.15 %

This chapter gives the limitations, procedures and performance for operation from/to this runway.
This supplement is only valid for the current PAPI slope at El Salvador that is set at -1.3 °.
This chapter does not constitute an operational approval to operate on this runway. Such authorization must be obtained by the operator from the appropriate authorities.

LIMITATIONS

Ident.: PRO-SPO-62-00002096.0001001 / 21 MAR 17

2 **Applicable to: MSN 02321, 02887-02904, 04563, 05005, 05097, 08495-09324, 10949-11522, 11572-11597**

At El Salvador, the mean runway slope is 3.15 %.
Takeoff must be performed downhill.
Landing must be performed uphill.
Autoland is not allowed.

PROCEDURES

Ident.: PRO-SPO-62-00002097.0001001 / 21 MAR 17

3 **Applicable to: MSN 02321, 02887-02904, 04563, 05005, 05097, 08495-09324, 10949-11522, 11572-11597**

Minimum approach speed is VLS +5 kt.

PERFORMANCE

Ident.: PRO-SPO-62-00002098.0001001 / 21 MAR 17

4 **Applicable to: MSN 02321, 02887-02904, 04563, 05005, 05097, 08495-09324, 10949-11522, 11572-11597**

The Performance Engineering Program/AFM_OCTO Flight Manual modules at the approved revision given in AFM (*Refer to AFM/AFM/PERF/OCTO Performance Database*) have to be used for takeoff and landing.
Takeoff performance must be computed by entering the mean runway slope.
Landing distance determination does not require any speed increment.

Intentionally left blank

OVERVIEW

Ident.: PRO-SPO-85-00020844.0001001 / 28 NOV 19
Applicable to: ALL

Simultaneous Parallel Approach operations permit ILS/RNAV(GNSS)/RNAV(RNP)/GLS instrument approaches to be performed to dual or triple parallel runway configurations.

Two types of simultaneous approaches to parallel or near-parallel instrument runways exist:
- Independent Approaches, where radar separation minima between aircraft on adjacent extended runway center lines are not prescribed and approaches are monitored to ensure aircraft do not enter a No Transgression Zone (NTZ). A Precision Runway Monitor (PRM) system which enables simultaneous close parallel approaches may also be employed. The air traffic controllers use the PRM system to monitor the aircraft position.
- Dependent Approaches, where radar separation minima between aircraft on adjacent extended runway center lines are prescribed and aircraft are staggered to provide separation from the adjacent final course.

To perform Simultaneous Parallel Approach operations:
- The ATC and flight crew must satisfy specific training requirements.
- The ATC and the aircraft equipment must also comply with specific requirements.

BREAK OUT TURN AND CLIMB PROCEDURE

Ident.: PRO-SPO-85-00020845.0001001 / 17 MAR 17
Applicable to: ALL

Simultaneously:

AP.. OFF
BREAK OUT LEFT(RIGHT), HDG___, ALT___... ANNOUNCE
THRUST LEVERS...TOGA, and back to CL

L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
The FMS GO-AROUND phase becomes active. Therefore, the FMS reinserts the approach.

L1 TURN LEFT(RIGHT) AND CLIMB

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

Then

L1 HDG___ .... TURN AND PULL

L2 *The GA TRK mode disengages, and the HDG mode engages.*

L1 ALT___ .... TURN AND PULL

L2 *The SRS GA mode disengages, and the OP CLB mode engages. The speed target becomes the FMS speed target of the CLIMB phase.*

L1 SPEED .... PULL AND ADJUST

L2 *For the initial break out procedure, adjust the speed (e.g. 160 kt), in order to avoid a significant acceleration, and an increase in workload.*

L1 ● **When established on the break out path:**

AP .... ON

L2 *Before engaging the AP, ensure that the FD bar orders correspond to the aircraft current path.*

L1 SPEED .... SELECT AS RQRD
FLAPS .... AS RQRD
GEAR .... AS RQRD
TCAS MODE SEL .... TA/RA AS RQRD

BREAK OUT TURN AND DESCENT PROCEDURE

Ident.: PRO-SPO-85-00020846.0001001 / 17 MAR 17
Applicable to: ALL

Simultaneously:

AP .... OFF
TURN LEFT(RIGHT) AND MAINTAIN RATE OF DESCENT
BREAK OUT LEFT(RIGHT), HDG___, ALT___ .... ANNOUNCE

L2 *As the situation is urgent, the flight crew should temporarily disregard the FD orders.*

Then

L1 HDG___ .... TURN AND PULL

L2 *The HDG mode engages. The vertical mode reverts to the V/S mode. The vertical speed target is the aircraft vertical speed at V/S engagement.*

L1 ALT___ .... TURN AND PULL

L2 *This action defines an altitude target. The OP DES mode and the THR IDLE mode engage. The speed target does not change.*

L1 V/S .... MONITOR

CAUTION	*Depending on the speed target, the vertical speed may become excessive. If the rate of descent exceeds 1 000 ft/min, engage the V/S mode and limit the rate of descent to 1 000 ft/min.*

- **When established on the break out path:**

  AP .... ON

  L2 *Before engaging the AP, ensure that the FD bar orders correspond to the aircraft current path.*

L1
- **When cleared by ATC:**

  ALT___ .... TURN

  L2 *Select an altitude target for go-around, in accordance with the ATC clearance.*

  L1 THRUST LEVERS .... TOGA, and back to CL

  L2 *The SRS GA and the GA TRK modes engage. The THR CLB mode engages.*
  The speed is managed. The speed target is the aircraft speed at SRS GA engagement.
  The FMS GO-AROUND phase becomes active.

  L1 HDG___ .... PULL

  L2 *The GA TRK mode disengages, and the HDG mode engages. The SRS GA mode remains engaged, until ALT* engagement.*

  L1 SPEED .... SELECT AS RQRD
  FLAPS .... AS RQRD
  GEAR .... AS RQRD
  TCAS MODE SEL .... TA/RA AS RQRD

WIND FOR TAKEOFF AND LANDING

Maximum demonstrated crosswind (takeoff and landing)........................ 38 kt (gust included)

Note:
- *The maximum demonstrated crosswind value is not an Airplane Flight Manual (AFM) limitation : It is the maximum crosswind condition experienced during the aircraft certification campaign.*
- *Airbus recommends that operators should not intentionally operate in crosswinds that exceed this value.*

PASSENGER AND CARGO DOORS OPERATION

The following are the wind limitations for passenger and cargo doors operation:
- The maximum wind for passenger door operation is 65 kt
- The maximum wind for FWD and AFT cargo door operation is 40 kt (or 50 kt, if the aircraft nose is into the wind, or if the FWD and AFT cargo doors are on the leeward side)
- The FWD and AFT cargo doors must be closed before the wind speed exceeds 65 kt.

- **When the takeoff weight is higher than 76 000 kg (167 550 lb):**

CAUTION	Do not exceed a taxi speed of 20 kt during a turn.

WIPERS MAXIMUM OPERATING SPEED

Ident.: LIM-AG-SPD-00001903.0001001 / 17 MAR 17
Applicable to: ALL

Maximum speed...230 kt

L2 *Note:* *This limitation is applicable when the wipers are sweeping. It is not applicable if the wipers are not sweeping for any reasons.*

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001893.0113001 / 18 MAR 11
Applicable to: MSN 02321, 02887

Maximum taxi weight........70 400 kg (155 205 lb)
Maximum takeoff weight (brake release)........70 000 kg (154 323 lb)
Maximum landing weight........62 500 kg (137 788 lb)
Maximum zero fuel weight........58 500 kg (128 970 lb)
Minimum weight........35 400 kg (78 044 lb)

In exceptional cases (in flight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided the pilot follows the overweight landing procedure.

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001893.0486001 / 18 MAR 11
Applicable to: MSN 01459

Maximum taxi weight........75 900 kg (167 330 lb)
Maximum takeoff weight (brake release)........75 500 kg (166 448 lb)
Maximum landing weight........64 500 kg (142 198 lb)
Maximum zero fuel weight........61 000 kg (134 481 lb)
Minimum weight........37 230 kg (82 079 lb)

In exceptional cases (in flight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided the pilot follows the overweight landing procedure.

WEIGHT LIMITATIONS

Ident.: LIM-AG-WGHT-00001893.0295001 / 18 MAR 11
Applicable to: MSN 05643-05883

Maximum taxi weight........77 400 kg (170 637 lb)
Maximum takeoff weight (brake release)........77 000 kg (169 755 lb)
Maximum landing weight........64 500 kg (142 198 lb)
Maximum zero fuel weight........61 000 kg (134 481 lb)
Minimum weight........37 230 kg (82 079 lb)

In exceptional cases (in flight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided the pilot follows the overweight landing procedure.

WEIGHT LIMITATIONS

Maximum landing weight	64 500 kg (142 198 lb)
Maximum zero fuel weight (for MTOW 1)*	61 000 kg (134 481 lb)
Maximum zero fuel weight (for MTOW 2)*	60 500 kg (133 379 lb)
Minimum weight	37 230 kg (82 079 lb)

* Dual MTOW is certified. A placard fitted on the aircraft must reflect the current MTOW.
In exceptional cases (in flight turn back or diversion), an immediate landing at weight above maximum landing weight is permitted, provided the pilot follows the overweight landing procedure.

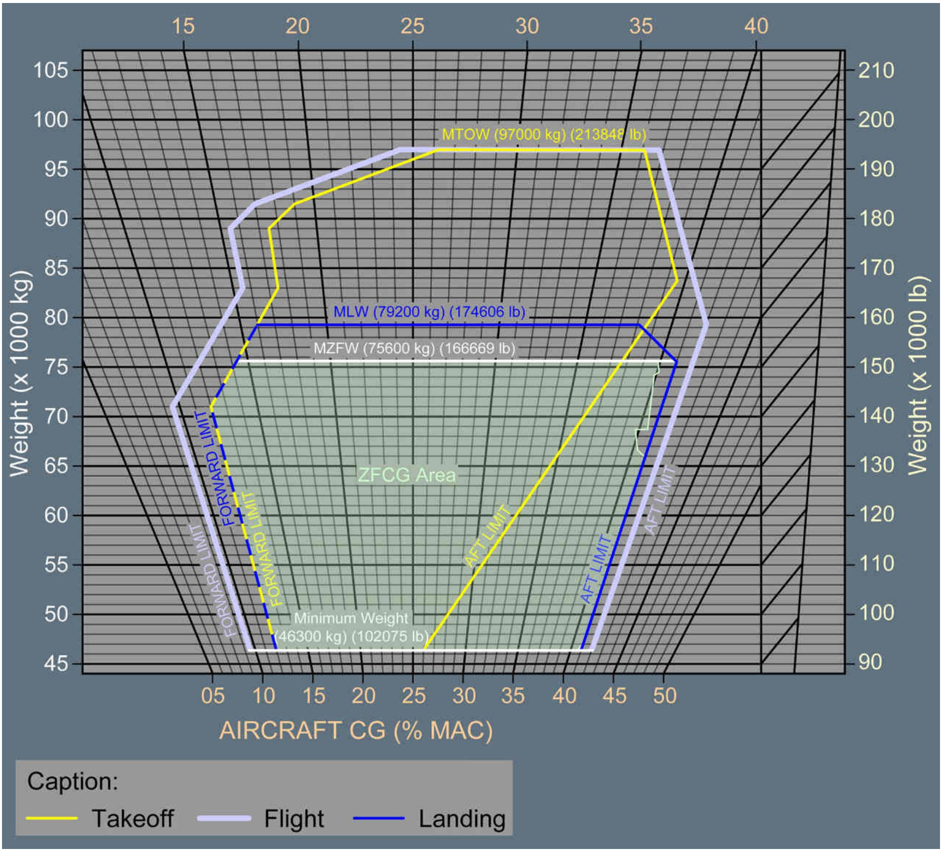
CENTER OF GRAVITY LIMITS WITH UP TO 3 ACTS INSTALLATION

4 Ident.: LIM-AG-WGHT-00022520.0005001 / 04 SEP 18
Applicable to: MSN 11531

The CG envelope provides the CG limits for the highest certified MTOW, MLW and MZFW. The CG limits of the aircraft must be restricted according to the aircraft MTOW, MLW and MZFW given in the Weight Limitations chapter.
The ZFCG at dispatch must be within the ZFCG area.

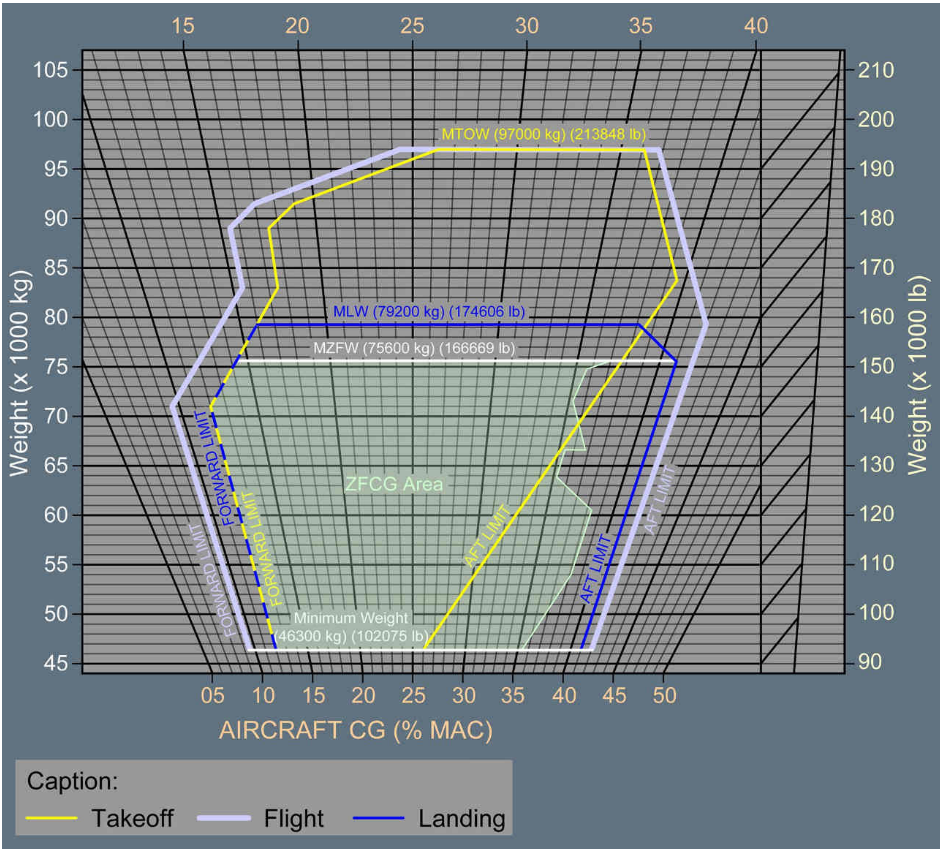
1. The following CG envelope is valid for:
   - Aircraft with only one ACT (AFT1 ACT) installed and refueled.
   - Aircraft with two or three ACTs installed, but only one ACT (AFT1 ACT) refueled.

CG Envelope - One ACT refueled



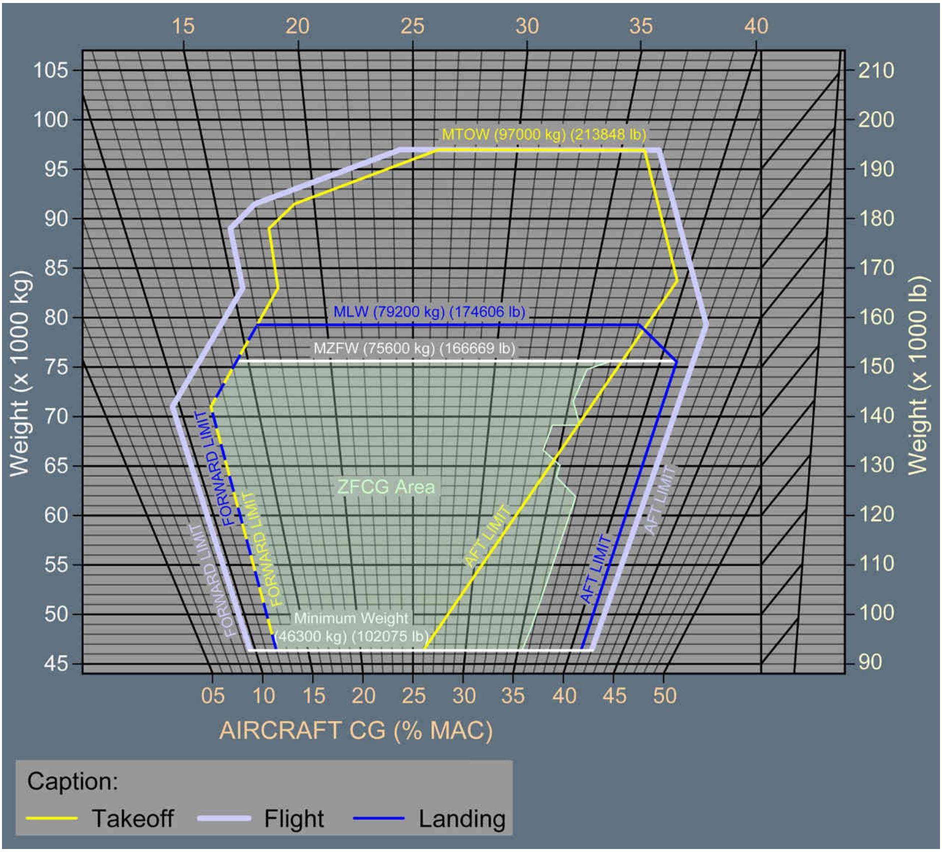
2. The following CG envelope is valid for:
   - Aircraft with only two ACTs (AFT1 ACT and AFT2 ACT) installed and two ACTs refueled.
   - Aircraft with three ACTs installed, but only two ACTs (AFT1 ACT and AFT2 ACT) refueled.

CG Envelope - Two ACTs refueled



3. The following CG envelope is valid for:
   - Aircraft with three ACTs (FWD ACT, AFT1 ACT and AFT2 ACT) installed and three ACTs refueled.

CG Envelope - Three ACTs refueled



- CG limits are given in percentage of the reference chord length aft of the leading edge.
- The reference chord length is 4.193 m (13.76 ft). It is 20.58 m (67.51 ft) aft of the aircraft nose.

Intentionally left blank

GENERAL

Ident.: LIM-AIR-00020807.0001001 / 17 MAR 17
Applicable to: ALL

With passengers on board, it is not recommended to exceed 20 min without air conditioning supply. The lack of fresh air supply will significantly reduce the cabin's air quality.

APU BLEED USE WITH HP AIR START UNIT

Ident.: LIM-AIR-00020084.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew must not use bleed air from the APU BLEED and from the HP Air Start Unit at the same time, to prevent any adverse effect on the Bleed Air System.

AVIONICS VENTILATION

Ident.: LIM-AIR-00020086.0001001 / 17 MAR 17
Applicable to: ALL

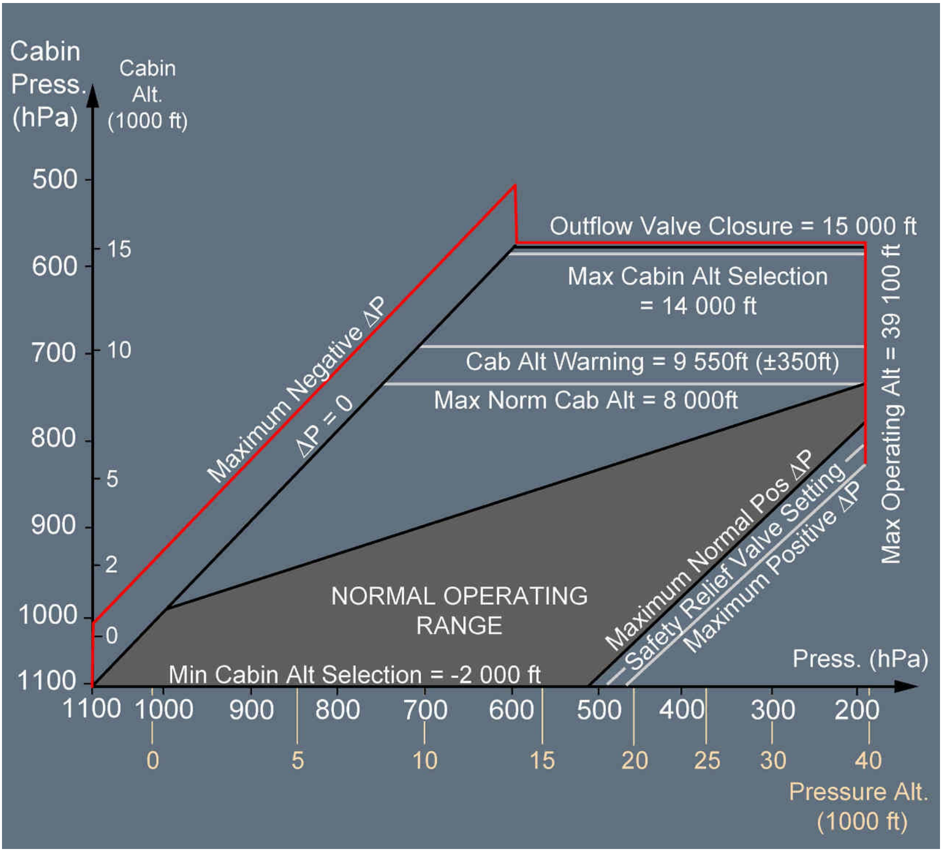
During ground operations and depending on the Outside Air Temperature (OAT), the flight crew must limit the time that the aircraft electric power supply is used, in normal avionics ventilation system configuration, as follows:

OAT ≤ 49 °C	No limitation
49 °C < OAT ≤ 55 °C	2 h
55 °C < OAT ≤ 60 °C	1 h
60 °C < OAT ≤ 64 °C	0.5 h

CABIN PRESSURE

Ident.: LIM-AIR-00020085.0001001 / 17 MAR 17
Applicable to: MSN 01143-01459

Maximum positive differential pressure	9.0 PSI
Maximum negative differential pressure	-1.0 PSI
Safety relief valve setting	8.6 PSI



Note: *Maximum differential pressure (Δp) and safety valve setting tolerance = ± 7 hPa (0.1 PSI).*

The AP or FD in OP DES or DES mode can be used in approach. However, its use is only permitted if the FCU selected altitude is set to, or above, the higher of the two: MDA/MDH or 900 ft AGL.	

FLIGHT MANAGEMENT FUNCTION

Ident.: LIM-AFS-10-20-00020069.0001001 / 12 MAY 22
Applicable to: ALL

FMGS lateral and vertical navigation is certified for:
- After takeoff, en route, and terminal area operations
- Navigation within RNAV/RNP airspace
- Instrument approach procedures (except ILS, LOC, LOC B/C, LDA, SDF, GLS , MLS and FLS final approaches)
- Missed approach procedures.

The FLS function is certified for:
- RNAV, RNAV (GNSS) approach with LNAV/VNAV or LNAV minima, GPS, VOR, VOR/DME, NDB, NDB/DME instrument approach procedures, using FMS navigation for lateral and vertical navigation
- LOC, ILS (GS out), or LOC B/C instrument approaches, using FMS navigation for vertical navigation, associated with LOC or LOC B/C for lateral navigation.

The SLS function is certified for RNAV (GNSS) approach with LPV or LP minima.
Approval of the FMGS is based on the assumption that the navigation database is validated for intended use.
Obstacle clearance and adherence to airspace constraints remains a flight crew responsibility.
Fuel, time predictions/performance information is provided for advisory purposes only.

Ident.: LIM-AFS-10-20-00020070.0002001 / 17 MAR 17
Applicable to: ALL

NAVIGATION PERFORMANCE

The navigation accuracy depends on:

- IRS drift, or
- One of the following:
  - Radio navaid availability, or
  - Elapsed time since last computation of radio navaid position.

RNP accuracy with GPS PRIMARY ◁ is:

	With AP ON [(1)]	With AP OFF and FD ON [(1)]	With AP OFF and FD OFF
En route	1 NM	1 NM	1.1 NM
In terminal area	0.5 NM	0.51 NM	0.51 NM
In approach	0.3 NM	0.3 NM	0.3 NM with F-LOC ◁ deviation Not authorized without F-LOC ◁ deviation

(1)
- *In NAV (all phases), or*
- *In F-LOC ◁ (approach phase)*

Ident.: LIM-AFS-10-20-00020231.0005001 / 17 MAR 17
7 **Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11597**

- **For RNP AR:**
  The aircraft is capable of conducting RNP AR operations when operated in accordance with the recommendations provided in the Airbus Airworthiness Compliance Document (ACD).
  The achieved RNP AR level could be below 0.3 NM and depends on the type of RNP AR application. Refer to ACD for maximum achievable RNP values.

  RNP AR capability has been demonstrated with AP ON for the following modes:
  - Departure in NAV mode
  - Initial and Intermediate approach in NAV or APP NAV modes
  - Final approach in FINAL APP mode
  - Missed approach in NAV mode.

  Note: *For navigation performance and recommendations regarding RNP AR operations with AP OFF / FD ON, refer to the ACD.*

Ident.: LIM-AFS-10-20-00020389.0001001 / 04 MAY 18
Applicable to: ALL

DEGRADED SITUATION

If GPS PRIMARY LOST ◁ is displayed on the ND and MCDU, the navigation accuracy remains sufficient for RNP operations provided that, the RNP value is checked or entered on the MCDU and HIGH ACCURACY is displayed.

USE OF NAV MODE

Applicable to: ALL

Ident.: LIM-AFS-10-30-00020334.0001001 / 17 MAR 17

AFTER TAKEOFF

NAV mode may be used after takeoff provided that:
- GPS PRIMARY ◁ is available, or
- The flight crew checked the FMGS takeoff updating.

Ident.: LIM-AFS-10-30-00020335.0001001 / 17 MAR 17

IN TERMINAL AREA

NAV mode may be used in terminal area provided that:
- GPS PRIMARY ◁ is available, or
- the appropriate RNP is checked or entered on the MCDU, and HIGH accuracy is displayed, or
- FMS navigation is crosschecked with navaid raw data.

Ident.: LIM-AFS-10-30-00020336.0001001 / 17 MAR 17

APPROACH BASED ON RADIO NAVAIDS

A navaids approach may be performed in NAV, APP NAV or FINAL APP, with AP or FD engaged, provided that:
- If GPS PRIMARY ◁ is available, the reference navaid may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided that an operational approval is obtained
- If GPS PRIMARY is not available, the reference navaid and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

Note: *FLS ◁ is the recommended managed lateral and vertical guidance mode for radio navaids approach.*

Ident.: LIM-AFS-10-30-00020337.0001001 / 17 MAR 17

RNAV APPROACH

An RNAV(RNP) approach may be performed, with GPS PRIMARY not available, only if the radio navaid coverage supports the RNP value and HIGH accuracy is displayed on the MCDU with the specified RNP, and an operational approval is obtained.
An RNAV(GNSS) approach may be performed provided that GPS PRIMARY ◁ is available.
Refer to Guidance Modes per Approach Types

Note: *FLS ◁ is the recommended managed lateral and vertical guidance mode for RNAV approach.*

USE OF FLS ◁

Ident.: LIM-AFS-10-00020808.0001001 / 28 MAY 20
Applicable to: ALL

APPROACH BASED ON RADIO NAVAIDS

A navaids approach (e.g. VOR/DME) may be flown with the FLS provided that:
- F-APP capability is displayed on FMA.
  In this case, the reference navaids may be unserviceable, or the airborne radio equipment may be inoperative, or not installed, provided an operational approval is obtained.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids and the corresponding airborne radio equipment must be serviceable, tuned and monitored during the approach.

An ILS (G/S out), ILS-B/C (G/S out), LOC, LOC-B/C approach may be flown with the lateral LOC (LOC B/C) mode and with the F-G/S mode of FLS function provided that:
- F-APP capability is displayed on FMA.
  In this case, the reference navaids used for the vertical path validation must be tuned and checked at final descent point.
- F-APP + RAW capability is displayed on FMA.
  In this case, the reference navaids used for the vertical path validation must be tuned and checked at final descent point and monitored during the approach.

RNAV(GNSS) APPROACH

An RNAV(GNSS) approach with LNAV minimum may be flown with the FLS provided that the F-APP capability is displayed on FMA.
An RNAV(GNSS) approach with LNAV/VNAV minimum must be flown with the FLS provided that the F-APP capability is displayed on FMA.

Note: *The RNAV(GNSS) approach limitations and procedures must be used to perform an RNAV approach for which the GNSS is not required.*

NON-PRECISION APPROACHES WITH ENGINE-OUT

Ident.: LIM-AFS-10-00006519.0001001 / 09 FEB 11
Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03294, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05345, 06895

If one engine is inoperative, it is not permitted to use the autopilot to perform NPAs in the following modes: FINAL APP, NAV V/S, NAV/FPA.
Only FD use is permitted.

NAVIGATION DATABASE VALIDATION

Ident.: LIM-AFS-10-40-00021656.0002001 / 05 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734, 02896-03002, 03035-03565, 03630-03662, 03761-03816, 04352-04358, 04441-04544, 04570-04662, 04827-04974, 05066, 05101-05222

RNAV(GNSS) APPROACHES AND APPROACHES BASED ON VOR/NDB

To fly an approach in lateral managed mode or lateral and vertical managed mode, the approach stored in the Navigation database must be either:
- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, or
- Validated and approved by the Operator.

Note: *RNAV(GNSS) approaches lateral trajectories are geometrically based on waypoints coordinates. Thus, validating waypoints coordinate ensure no coding error on the approach and correct lateral trajectory. Observed lateral track degree of difference between MCDU F-PLN page display and charts may come from inconsistency between FMS MagVar and charted MagVar, which has no effect on lateral trajectory.*

Ident.: LIM-AFS-10-40-00021656.0006001 / 05 MAY 22
8 **Applicable to: MSN 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05240-05987, 06097, 06121, 06139-09324, 10949-11597**

RNAV(GNSS) APPROACHES AND APPROACHES BASED ON VOR/NDB

To fly an approach in lateral managed mode or lateral and vertical managed mode, the approach stored in the Navigation database must be either:
- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, or
- Validated and approved by the Operator.

Note: *RNAV(GNSS) approaches lateral trajectories are geometrically based on waypoints coordinates. Thus, validating waypoints coordinate ensure no coding error on the approach and correct lateral trajectory. Observed lateral track degree of difference between MCDU F-PLN page display and charts may come from inconsistency between FMS MagVar and charted MagVar, which has no effect on lateral trajectory.*

RNAV(RNP) APPROACHES

To fly an RNAV(RNP) procedure (departure, approach, missed approach), the procedure stored in the Navigation Database must be both:

- Produced by an approved supplier compliant with ED76/DO200A or DAT Type 2 requirements, and
- Validated and approved by the Operator.

ILS CATEGORY II

Ident.: LIM-AFS-20-00020136.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
For manual landing, AP should be disconnected no later than 80 ft AGL.

SPECIAL AUTHORIZATION CAT II (SA CAT II)

Ident.: LIM-AFS-20-00020138.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
With HUD ◁ , the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

OTHER THAN STANDARD CAT II (OTS CAT II)

Ident.: LIM-AFS-20-00020139.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..100 ft
At least one autopilot must be engaged in APPR mode, and CAT 2 or CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.
With HUD ◁ , the flight crew must use the HUD to monitor the approach and perform an automatic landing or a manual landing. If the flight crew performs an automatic approach without automatic landing, the autopilot must be disengaged no later than at 80 ft AGL.
Without HUD, the flight crew must perform an automatic landing.

ILS CATEGORY III FAIL PASSIVE (SINGLE)

Ident.: LIM-AFS-20-00020140.0001001 / 18 SEP 18
Applicable to: ALL

Minimum decision height..50 ft
A/THR must be used in selected or managed speed.
At least one autopilot must be engaged in APPR mode, and CAT 3 SINGLE or CAT 3 DUAL must be displayed on the FMA.

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020141.0001001 / 17 MAR 17

1 **Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05345, 08495-09324, 10949-11597**

Alert height....................100 ft AGL

A/THR must be used in selected or managed speed.

Both autopilots must be engaged in APPR mode, and CAT 3 DUAL must be displayed on the FMA.

- **CAT III without DH:**
  Minimum Runway Visual Range....................75 m

ILS CATEGORY III FAIL OPERATIONAL (DUAL)

Ident.: LIM-AFS-20-00020141.0008001 / 18 SEP 18

AUTOMATIC LANDING

Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896-02904

Ident.: LIM-AFS-20-10-00020149.0001001 / 17 MAR 17

ILS/MLS CAT II and CAT III autoland and GLS CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020150.0001001 / 17 MAR 17

Automatic landing is demonstrated:

- With CAT II and CAT III ILS/MLS beam and CAT I GLS beam.

Ident.: LIM-AFS-20-10-00020151.0001001 / 17 MAR 17

- With a glide slope angle between -2.5 ° and -3.15 °

Ident.: LIM-AFS-20-10-00020152.0007001 / 17 MAR 17

- With an airport elevation at or below 6 500 ft

Ident.: LIM-AFS-20-10-00021180.0003001 / 25 JAN 18

5 - With aircraft weight below the maximum landing weight

Ident.: LIM-AFS-20-10-00020155.0001001 / 17 MAR 17

Automatic landing is not allowed below -1 000 ft pressure altitude.

Ident.: LIM-AFS-20-10-00020156.0001001 / 05 MAR 19

Automatic rollout performance is approved on dry and wet runways, but performance on contaminated runways was not demonstrated.

During automatic rollout with one engine inoperative or one thrust reverser inoperative, the flight crew can use the remaining thrust reverser, provided that the wind does not exceed the maximum wind conditions for automatic rollout.

Ident.: LIM-AFS-20-10-00020158.0001001 / 17 MAR 17

Automatic landing system performance is demonstrated with CAT II or CAT III ILS/MLS airport installation. However, automatic landing in CAT I or better weather conditions is possible on CAT I ground installations or on CAT II/III ground installations when ILS/MLS sensitive areas are not protected, if the following precautions are taken:

- The airline checked that the ILS/MLS beam quality, and the effect of the terrain profile before the runway have no adverse effect on AP/FD guidance. Particularly, the effect of terrain profile within 300 m before the runway threshold must be evaluated
- The flight crew is aware that LOC or G/S beam fluctuations, independent of the aircraft system, may occur. The PF is prepared to immediately disconnect the autopilot, and to take the appropriate action, should not satisfactory guidance occur
- At least CAT2 capability is displayed on the FMA and the flight crew uses CAT II/III procedures
- Visual references are obtained at an altitude appropriate for the CAT I approach. If not, a go-around must be performed.

AUTOMATIC LANDING

Applicable to: MSN 01591, 01652, 01802, 01827, 01835, 01857-01891, 02513, 03727, 06057, 06103-06110, 06125, 09558-09563

Ident.: LIM-AFS-20-10-00020149.0001001 / 17 MAR 17

ILS/MLS CAT II and CAT III autoland and GLS CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020150.0001001 / 17 MAR 17

Automatic landing is demonstrated:
- With CAT II and CAT III ILS/MLS beam and CAT I GLS beam.

Ident.: LIM-AFS-20-10-00020158.0001001 / 17 MAR 17

Automatic landing system performance is demonstrated with CAT II or CAT III ILS/MLS airport installation. However, automatic landing in CAT I or better weather conditions is possible on CAT I ground installations or on CAT II/III ground installations when ILS/MLS sensitive areas are not protected, if the following precautions are taken:

AUTOMATIC LANDING

Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 04000-04192, 04389, 04563, 04773, 05345

Ident.: LIM-AFS-20-10-00020149.0001001 / 17 MAR 17

ILS/MLS CAT II and CAT III autoland and GLS CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020150.0001001 / 17 MAR 17

Automatic landing is demonstrated:

- With CAT II and CAT III ILS/MLS beam and CAT I GLS beam.

Ident.: LIM-AFS-20-10-00020151.0004001 / 17 MAR 17

6 - With a glide slope angle between -2.5 ° and -3.25 °

Ident.: LIM-AFS-20-10-00020152.0003001 / 17 MAR 17

7 - With an airport elevation at or below 9 200 ft

Ident.: LIM-AFS-20-10-00021180.0003001 / 25 JAN 18

8 - With aircraft weight below the maximum landing weight

Ident.: LIM-AFS-20-10-00020155.0001001 / 17 MAR 17

Automatic landing is not allowed below -1 000 ft pressure altitude.

Ident.: LIM-AFS-20-10-00020156.0007001 / 05 MAR 19

Automatic rollout performance is approved on dry and wet runways, but performance on contaminated runways was not demonstrated.

During automatic rollout with one engine inoperative or one thrust reverser inoperative, the flight crew can use the remaining thrust reverser, provided that:

AIRPORT ELEVATION AT OR BELOW 5 750 FT

- No more than idle thrust is used
- Headwind component not above 15 kt
- Tailwind component not above 10 kt
- Crosswind component not above 10 kt.

AIRPORT ELEVATION ABOVE 5 750 FT OR CONF 3

- No more than idle thrust is used
- Headwind component not above 15 kt
- Tailwind component not above 5 kt
- Crosswind component not above 10 kt.

Ident.: LIM-AFS-20-10-00020158.0001001 / 17 MAR 17

Automatic landing system performance is demonstrated with CAT II or CAT III ILS/MLS airport installation. However, automatic landing in CAT I or better weather conditions is possible on CAT I ground installations or on CAT II/III ground installations when ILS/MLS sensitive areas are not protected, if the following precautions are taken:

- The airline checked that the ILS/MLS beam quality, and the effect of the terrain profile before the runway have no adverse effect on AP/FD guidance. Particularly, the effect of terrain profile within 300 m before the runway threshold must be evaluated
- The flight crew is aware that LOC or G/S beam fluctuations, independent of the aircraft system, may occur. The PF is prepared to immediately disconnect the autopilot, and to take the appropriate action, should not satisfactory guidance occur
- At least CAT2 capability is displayed on the FMA and the flight crew uses CAT II/III procedures
- Visual references are obtained at an altitude appropriate for the CAT I approach. If not, a go-around must be performed.

AUTOMATIC LANDING

Applicable to: MSN 04827-04860

Ident.: LIM-AFS-20-10-00020149.0001001 / 17 MAR 17

ILS/MLS CAT II and CAT III autoland and GLS CAT I autoland are approved in CONF 3 and CONF FULL.

Ident.: LIM-AFS-20-10-00020150.0001001 / 17 MAR 17

Automatic landing is demonstrated:

- With CAT II and CAT III ILS/MLS beam and CAT I GLS beam.

Ident.: LIM-AFS-20-10-00020151.0001001 / 17 MAR 17

- With a glide slope angle between -2.5 ° and -3.15 °

Ident.: LIM-AFS-20-10-00020152.0001001 / 17 MAR 17

- With an airport elevation at or below 2 500 ft

Ident.: LIM-AFS-20-10-00021180.0003001 / 25 JAN 18

13 - With aircraft weight below the maximum landing weight

Ident.: LIM-AFS-20-10-00020155.0001001 / 17 MAR 17

Automatic landing is not allowed below -1 000 ft pressure altitude.

Ident.: LIM-AFS-20-10-00020156.0001001 / 05 MAR 19

Automatic rollout performance is approved on dry and wet runways, but performance on contaminated runways was not demonstrated.
During automatic rollout with one engine inoperative or one thrust reverser inoperative, the flight crew can use the remaining thrust reverser, provided that the wind does not exceed the maximum wind conditions for automatic rollout.

Ident.: LIM-AFS-20-10-00020158.0001001 / 17 MAR 17

Automatic landing system performance is demonstrated with CAT II or CAT III ILS/MLS airport installation. However, automatic landing in CAT I or better weather conditions is possible on CAT I ground installations or on CAT II/III ground installations when ILS/MLS sensitive areas are not protected, if the following precautions are taken:

- The airline checked that the ILS/MLS beam quality, and the effect of the terrain profile before the runway have no adverse effect on AP/FD guidance. Particularly, the effect of terrain profile within 300 m before the runway threshold must be evaluated

3 Ident.: LIM-EFB-46-20800857.9001001 / 02 MAY 23
Applicable to: ALL

Note: *The related EFB also has the Jeppesen Function and the Flysmart Function inoperative, the EFB is considered inoperative. Refer to 20800008 **Not found***

Note: *The EFB with all functions operative must be used by Pilots as required.*

ONE INOPERATIVE

One Documents Function may be inoperative without restriction.

BOTH INOPERATIVE

Both Documents Functions may be inoperative provided one paper copy of EOSIDs for departure, alternate and destination airports must be on board.

FLYSMART FUNCTION (OLB/LANDING/LOADSHEET/TAKEOFF)

4 Ident.: LIM-EFB-46-20800858.9001001 / 02 MAY 23
Applicable to: ALL

Note: *The EFB with all functions operative must be used by Pilots as required.*

Note: *Any individual FlySmart Function which operates normally may be used.*

Note: *The related EFB also has the Documents Function and the Jeppesen Function inoperative, EFB is considered inoperative. Refer to 20800008 **Not found***

ONE INOPERATIVE

One FlySmart Function may be inoperative without restriction.

BOTH INOPERATIVE

Both FlySmart Functions may be inoperative provided all the required calculations must be on board for departure, destination and alternate airports.

POWER CHARGER WITH CABLE

5 Ident.: LIM-EFB-46-20800859.9001001 / 02 MAY 23
Applicable to: ALL

Note: *Power charger and cable are considered as one piece.*

ONE INOPERATIVE

One Power charger with cable may be inoperative or missing provided the remaining power charger and cable are used for both iPads as required.

BOTH INOPERATIVE

Both Power chargers with cable may be inoperative provided two additional iPads must be onboard with a minimum battery charge of 80 %.

MOUNT

6 Ident.: LIM-EFB-46-20800860.9001001 / 02 MAY 23
Applicable to: ALL

ONE INOPERATIVE OR MISSING WITH KNEEBOARD CHECKED OPERATIVE

One may be inoperative or missing provided:

- Kneeboard must be used and checked operative, and
- Inoperative mount must be removed from Aircraft.

ONE INOPERATIVE OR MISSING WITH KNEEBOARD INOPERATIVE OR MISSING

If one mount is inoperative or missing and also the kneeboard is inoperative or missing, the related EFB is considered inoperative. The inoperative mount must be removed from the Aircraft.*Refer to 20800008 **Not found***

BOTH INOPERATIVE OR MISSING WITH KNEEBOARD CHECKED OPERATIVE

Both Mounts may be inoperative or missing provided:

- Kneeboard must be used and checked operative, and
- Inoperative mount must be removed from Aircraft, and
- Remaining iPad without kneeboard is considered inoperative.*Refer to 20800008 **Not found***

BOTH INOPERATIVE OR MISSING WITH KNEEBOARD INOPERATIVE OR MISSING

If both mounts are inoperative or missing and also the kneeboard is inoperative or missing, the iPads may be used without kneeboard except during Take off and Landing (when both iPads must be stowed) . Inoperative mounts must be removed from Aircraft. Also *Refer to 20800009 **Not found***

KNEEBOARD

7 Ident.: LIM-EFB-46-20800861.9001001 / 02 MAY 23
Applicable to: ALL

INOPERATIVE OR MISSING WITH RELATED MOUNT CHECKED OPERATIVE

Kneeboard may be inoperative or missing provided at least one Mount is used and checked operative.

INOPERATIVE OR MISSING WITH BOTH MOUNTS INOPERATIVE OR MISSING

The Kneeboard is inoperative or missing and also both Mounts are inoperative or missing, iPads may be used without kneeboard except during Take off and Landing (when both iPads must be stowed). Also .*Refer to 20800009 **Not found***

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

Maximum N1.. 104 %

Note: *The N1 limit depends on the ambient conditions and on the configuration of the engine air bleed. These parameters may limit N1 to a value that is less than the above-mentioned N1 value.*

Maximum N2.. 105 %

OIL

Ident.: LIM-ENG-00020354.0001001 / 10 MAY 21

Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

OIL TEMPERATURE

Maximum continuous temperature.. 140 °C
Maximum transient temperature (15 min).. 155 °C
Minimum starting temperature..-40 °C
Minimum temperature before takeoff.. -10 °C

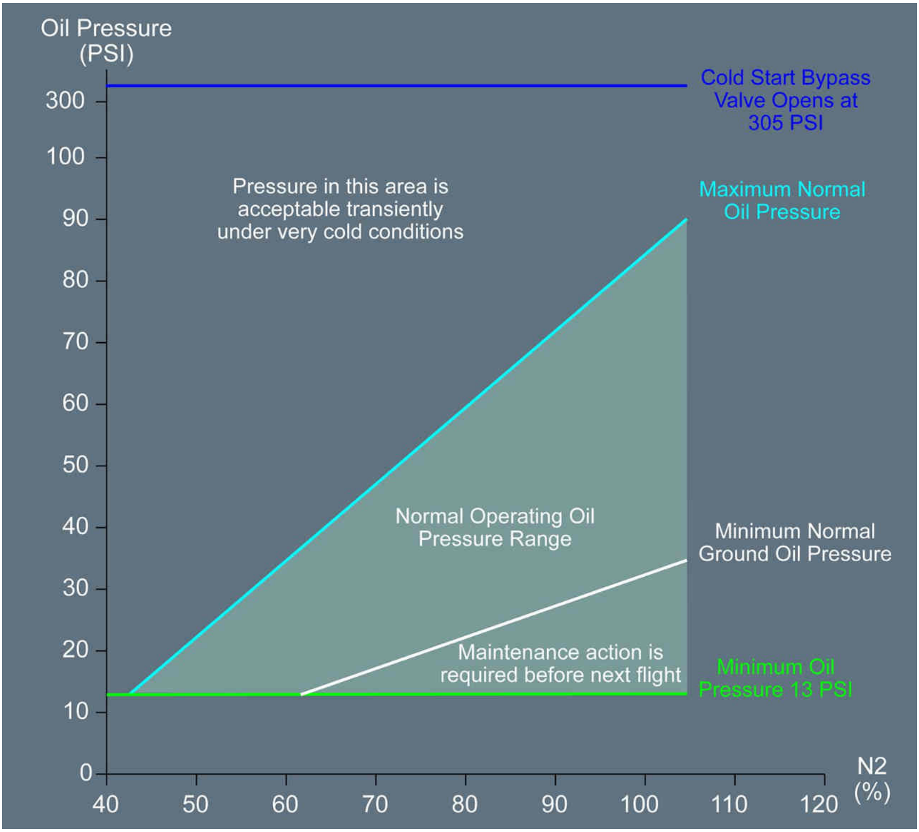
OIL QUANTITY

Minimum oil quantity.. 9.5 qt + estimated consumption

Average estimated consumption = 0.5 qt/h.

OIL PRESSURE

MIN/MAX Oil Pressure (ECAM Indication)



OIL

Ident.: LIM-ENG-00020354.0010001 / 10 MAY 21

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

OIL TEMPERATURE

Maximum continuous temperature.. 155 °C
Maximum transient temperature (15 min).. 165 °C
Minimum starting temperature... -40 °C

Minimum temperature before IDLE is exceeded.........-10 °C
Minimum temperature before takeoff......... 50 °C

OIL QUANTITY

Minimum oil quantity......... 11 qt + estimated consumption

Average estimated consumption = 0.3 qt/h.

MINIMUM OIL PRESSURE

Minimum oil pressure.........60 PSI

OIL

Ident.: LIM-ENG-00020354.0011001 / 03 NOV 21

3 **Applicable to: MSN 08495-09324, 10949-11597**

OIL TEMPERATURE

Maximum temperature.........151 °C
Minimum starting temperature.........-40 °C
Minimum temperature before takeoff......... 52 °C

OIL QUANTITY

Temperature	Minimum oil quantity
OAT at or above -30 °C	14 qt
OAT below -30 °C	16.5 qt

Note: *One of the following actions or oil system characteristics can cause indications of reduced oil quantity on the ENG SD page:*
- *If oil drains from the oil tank to the engine after oil servicing, or*
- *If an engine crank or an engine run is performed on the engine before the flight.*

As a result, if the oil quantity indicated on the ENG SD page is less than the minimum oil quantity defined above, perform one of the following:
- *Check that the oil tank level, that was reported in the technical logbook, is above the minimum oil quantity, or*
- *Check in the technical logbook that the oil tank was fully filled.*

MINIMUM OIL PRESSURE

Minimum oil pressure.........65 PSI

MAXIMUM OIL PRESSURE

Maximum oil pressure.........270 PSI

STARTER

Ident.: LIM-ENG-00020356.0004001 / 04 JUN 19
4 **Applicable to: MSN 08495-09324, 10949-11597**

- A standard automatic start that includes up to two start attempts, is considered one cycle
- For ground starts (automatic or manual), a 35 s pause is required between successive cycles
- A 15 min cooling period is required, subsequent to three failed cycles, or 15 min of continuous or cumulated crank
- The starter must not be run when N2 is above 20 %.

STARTER

Ident.: LIM-ENG-00020356.0002001 / 20 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

- A standard automatic start that includes only one start attempt, is considered one cycle
- For ground starts (automatic or manual), a 15 s pause is required between successive cycles
- A 30 min cooling period is required, subsequent to three failed cycles or 5 min of continuous crank
- For manual start, observe a two-minute maximum cycle time
- For crank, observe a 5 min maximum cycle time
- The starter must not be run when N2 is above 10 % on-ground and 18 % in-flight.

STARTER

Ident.: LIM-ENG-00020356.0001001 / 20 MAR 17
Applicable to: MSN 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05883, 06139, 06173-07098

- A standard automatic start that includes up to three start attempts, is considered one cycle
- For ground starts (automatic or manual), a 20 s pause is required between successive cycles
- A 15 min cooling period is required, subsequent to four failed cycles
- The starter must not be run when N2 is above 20 %.

REVERSE THRUST

Ident.: LIM-ENG-00020357.0001001 / 20 MAR 17
Applicable to: ALL

Selection of the reverse thrust is prohibited in flight.
Backing the aircraft with reverse thrust is not permitted.
Maximum reverse should not be used below 70 kt. Idle reverse is permitted down to aircraft stop.

REDUCED THRUST TAKEOFF

Ident.: TDU / LIM-ENG-10-00020362.0005001 / 20 MAR 17
Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 04000-04192, 04389, 04563, 04773, 05345
Impacted DU: 00020358 Flex Takeoff

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:

- Higher than TMAXFLEX, equal to ISA + 65 °C.

  Note: *When engine anti-ice is on, the flexible temperature is limited to ISA + 60 °C (TMAXFLEX).*

- Lower than the flat rating temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020358.0050001 / 05 MAR 19
Applicable to: MSN 08495-09324

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:

- Higher than TMAXFLEX, equal to ISA + 49 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020358.0046001 / 01 JUN 17
5 **Applicable to: MSN 10949-11522, 11572-11597**

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.

TFLEX cannot be:
- Higher than TMAXFLEX, equal to ISA + 50 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

6 Ident.: LIM-ENG-10-00020358.0044001 / 01 JUN 17
Applicable to: MSN 11531

Applicable to: MSN 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

FLEX TAKEOFF

Takeoff at reduced thrust, so-called as FLEX takeoff, is permitted only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).
Takeoff at reduced thrust is permitted with any inoperative item affecting the performance only if the associated performance shortfall has been applied to meet the above requirements.
FLEX takeoff is not permitted on contaminated runways.
The flexible takeoff thrust must never be below the MCT at ISA + 40 °C.

TFLEX cannot be:

- Higher than TMAXFLEX, equal to ISA + 43 °C.
- Lower than the flat temperature (TREF).
- Lower than the actual OAT.

Ident.: LIM-ENG-10-00020359.0001001 / 20 MAR 17
Applicable to: ALL

DERATED TAKEOFF

Selection of TOGA thrust is not permitted when a derated takeoff is performed, except when requested in any abnormal or emergency procedures.
The use of reduced thrust takeoff (FLEX takeoff) is not permitted in association with derated takeoff.
The use of derated takeoff is permitted regardless of the runway condition (dry, wet, or contaminated).

CROSSWIND OPERATION ON GROUND

Ident.: LIM-ENG-00020360.0003001 / 20 MAR 17
7 **Applicable to: MSN 08495-09324, 10949-11597**

ENGINE START

The engine is able to start in crosswind up to 35 kt.

CROSSWIND OPERATION ON GROUND

FUEL TEMPERATURE LIMITS WHEN JP4 AND JET B FUELS ARE USED

Ident.: LIM-FUEL-00019709.0001001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173

If the wing fuel temperature exceeds 30 °C at engine start, the altitude must be limited to 35 000 ft until the center tank is empty.
If the wing fuel temperature exceeds 40 °C at engine start, the altitude must be limited to 30 000 ft until the center tank is empty.
If the wing fuel temperature exceeds 49 °C at engine start, the altitude must be limited to 25 000 ft until the center tank is empty.

Reason : At high altitude with high fuel temperature, the pressure supplied by the center tank pumps becomes lower than the pressure supplied by the wing tank pumps.

MAXIMUM ALLOWED FUEL IMBALANCE

Ident.: LIM-FUEL-00020435.0001001 / 17 MAR 17
3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733, 04000-04192, 04389-04563, 04734-05345, 05591-05883, 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 08495-09324, 10949-11522, 11572-11597**

The following tables indicate the maximum allowed wing imbalance at takeoff, in flight, and at landing.

FUEL IMBALANCE AT TAKEOFF

INNER TANKS (OUTER TANKS BALANCED)

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	500 kg (1 102 lb)
3 000 kg (6 613 lb)	1 050 kg (2 314 lb)
1 450 kg (3 196 lb)	1 450 kg (3 196 lb)

The variation is linear between these values.

OUTER TANKS (INNER TANKS BALANCED)

Maximum Asymmetry	370 kg (815 lb)

FUEL IMBALANCE IN FLIGHT AND AT LANDING

INNER TANKS (OUTER TANKS BALANCED)

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	1 500 kg (3 306 lb)
4 300 kg (9 479 lb)	1 600 kg (3 527 lb)
2 250 kg (4 960 lb)	2 250 kg (4 960 lb)

The variation is linear between these values, and there is no limitation below 2 250 kg (4 960 lb).

OUTER TANKS

Maximum Asymmetry	690 kg (1 521 lb)(1)

(1) *The maximum fuel imbalance in the outer wing fuel tanks (one full/one empty) is allowed provided that:*
- *The fuel quantity of the outer and inner wing fuel tanks of one side is equal to the fuel quantity of the outer and inner wing fuel tanks on the other side, or*
- *On the side of the lighter outer tank, the fuel quantity of the inner tank is more than the fuel quantity of the opposite inner tank. The difference between the fuel quantity in the inner tanks should not be more than 3 000 kg (6 613 lb).*

Note: *In exceptional conditions (i.e. fuel system failure), the above-mentioned values for maximum fuel imbalance may be exceeded without significant effect to the aircraft handling qualities. The aircraft remains fully controllable in all flight phases.*

MAXIMUM ALLOWED FUEL IMBALANCE

Ident.: LIM-FUEL-00020435.0004001 / 17 MAR 17

Applicable to: MSN 03222-03229, 03294, 03761-03816, 04352-04358, 04570-04662

The following tables indicate the maximum allowed wing imbalance at takeoff, in flight, and at landing.

FUEL IMBALANCE AT TAKEOFF

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	600 kg (1 323 lb)
3 400 kg (7 496 lb)	600 kg (1 323 lb)
1 200 kg (2 646 lb)	1 200 kg (2 646 lb)

The variation is linear between these values.

FUEL IMBALANCE IN FLIGHT AND AT LANDING

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	1 320 kg (2 910 lb)
4 000 kg (8 818 lb)	1 450 kg (3 196 lb)
2 350 kg (5 180 lb)	2 350 kg (5 180 lb)

The variation is linear between these values, and there is no limitation below 2 350 kg (5 180 lb).

Note: *In exceptional conditions (i.e. fuel system failure), the above-mentioned values for maximum fuel imbalance may be exceeded without significant effect to the aircraft handling qualities. The aircraft remains fully controllable in all flight phases.*

MAXIMUM ALLOWED FUEL IMBALANCE

Ident.: LIM-FUEL-00020435.0008001 / 17 MAR 17

4 **Applicable to: MSN 05528, 05947-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098, 11531**

The following tables indicate the maximum allowed wing imbalance at takeoff, in flight, and at landing.

FUEL IMBALANCE AT TAKEOFF

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	400 kg (882 lb)
3 000 kg (6 614 lb)	400 kg (882 lb)
700 kg (1 543 lb)	700 kg (1 543 lb)

The variation is linear between these values.

FUEL IMBALANCE IN FLIGHT AND AT LANDING

Tank Fuel Quantity (Heavier Tank)	Maximum Asymmetry
Full	1 320 kg (2 910 lb)
4 000 kg (8 818 lb)	1 450 kg (3 196 lb)
2 350 kg (5 180 lb)	2 350 kg (5 180 lb)

The variation is linear between these values, and there is no limitation below 2 350 kg (5 180 lb).

Note: *In exceptional conditions (i.e. fuel system failure), the above-mentioned values for maximum fuel imbalance may be exceeded without significant effect to the aircraft handling qualities. The aircraft remains fully controllable in all flight phases.*

MINIMUM FUEL QUANTITY FOR TAKEOFF

Ident.: LIM-FUEL-00019771.0001001 / 17 MAR 17
Applicable to: ALL

Minimum fuel quantity for takeoff..1 500 kg (3 307 lb)
The ECAM alerts that are related to fuel low level in the wing tanks (FUEL WING TK LO LVL, etc.) must not appear for takeoff.

ICE AND RAIN PROTECTION

Intentionally left blank

Definition of Icing Conditions.......A
Definition of Severe Ice Accretion.......B
Definition of Thin Hoarfrost.......C
Rain Repellent ....D
Wipers Maximum Operating Speed.......E

Intentionally left blank

DEFINITION OF ICING CONDITIONS

Ident.: LIM-ICE_RAIN-00020608.0001001 / 05 JUN 18
Applicable to: ALL

- Icing conditions exist when the OAT (on ground or after takeoff) or the TAT (in flight) is at or below 10 °C and visible moisture in any form is present (such as clouds, fog with visibility of 1 sm (1 600 m) or less, rain, snow, sleet or ice crystals).
- Icing conditions also exist when the OAT on the ground and for takeoff is at or below 10 °C and operating on ramps, taxiways or runways where surface snow, standing water or slush may be ingested by the engines, or freeze on engines, nacelles or engine sensor probes.

DEFINITION OF SEVERE ICE ACCRETION

Ident.: LIM-ICE_RAIN-00020609.0001001 / 17 MAR 17
Applicable to: ALL

Ice accretion is considered severe when the ice accumulation on the airframe reaches approximately 5 mm (0.2 in) thick or more.

DEFINITION OF THIN HOARFROST

Ident.: LIM-ICE_RAIN-00020610.0001001 / 17 MAR 17
Applicable to: ALL

Thin hoarfrost is typically a white crystalline deposit which usually develops uniformly on exposed surfaces on cold and cloudless nights.
It is so thin that surface features (lines or markings) can be distinguished beneath it.

RAIN REPELLENT ◁

Ident.: LIM-ICE_RAIN-00020224.0001001 / 17 MAR 17
Applicable to: ALL

The flight crew should only use the rain repellent in the case of moderate to heavy rain.

WIPERS MAXIMUM OPERATING SPEED

Ident.: LIM-ICE_RAIN-00020225.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Wipers Maximum Operating Speed.

PRELIMINARY PAGES - TABLE OF CONTENTS

Braking System....A
Brake Temperature....B
Maximum Speeds with the Landing Gear Extended....C
Maximum Tire Speed....D
Nosewheel Steering (NWS)....E
Taxi with Deflated or Damaged Tires....F

Intentionally left blank

BRAKING SYSTEM

Ident.: LIM-LG-00020233.0001001 / 17 MAR 17
Applicable to: ALL

The braking system is not designed to hold the aircraft in a stationary position when a high thrust level is applied on at least one engine.
During ground procedures that require a thrust increase with braking, the flight crew must ensure that the aircraft remains stationary, and must be ready to immediately retard the thrust levers to IDLE.

BRAKE TEMPERATURE

Ident.: LIM-LG-00020255.0001001 / 17 MAR 17
Applicable to: ALL

Maximum brake temperature for takeoff (brake fans ✻ off)..300 °C

MAXIMUM SPEEDS WITH THE LANDING GEAR EXTENDED

Ident.: LIM-LG-00020237.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Speeds with the Landing Gear Extended.

MAXIMUM TIRE SPEED

Ident.: LIM-LG-00020238.0001001 / 17 MAR 17
Applicable to: ALL

Refer to LIM-AG-SPD Maximum Tire Speed.

NOSEWHEEL STEERING (NWS)

Ident.: LIM-LG-00020236.0001001 / 12 SEP 17
Applicable to: ALL

For NWS angle limit, *Refer to DSC-20-30 Taxiing*.
Towbarless operation on the nose landing gear (towing and pushback) is approved when using the accepted towbarless towing vehicles listed in the Airbus WISE ISI 09.11.00001, with the following information:
Maximum NWS angle... ±85 °

TAXI WITH DEFLATED OR DAMAGED TIRES

Ident.: LIM-LG-00020235.0001001 / 01 JUN 17
Applicable to: ALL

To vacate the runway or taxi at low speed with tire(s) deflated (not damaged), all of the following limitations apply:

- If maximum one tire per gear is deflated (consider three gears)
  Maximum taxi speed during turn.......... 7 kt
- If two tires are deflated on the same main gear (maximum one main gear)
  Maximum taxi speed.......... 3 kt
- For the nosewheel steering (NWS) angle
  Maximum NWS angle.......... 30 °

In addition, if tire damage is suspected, the flight crew must ask for an aircraft inspection prior to vacate the runway or taxi. If the ground crew suspects that a tire burst may damage the landing gear, maintenance action is due.
For more information, *Refer to FCTM/PR-AEP-LG Taxi with Deflated or Damaged Tires*.

ROW/ROP

Ident.: LIM-ROW_ROP-00016038.0011001 / 28 MAY 20
1 **Applicable to: MSN 10949-11597**

In the case of runways that are not validated for ROPS in the GPWS database, ROPS is inoperative. It is the operator's responsibility to inform the flight crews about the runways that are not validated for ROPS, along the scheduled route.
The ROPS function may be inhibited (ROW/ROP pb-sw set to OFF on SURV panel) for specific approach procedures which have previously been identified as potentially producing undue ROW alerts.
Operations where the FLD assessed during the descent preparation is greater than the LDA must not be conducted, unless specific authorization is obtained from the appropriate authority. For these runways, ROW alerts may be triggered if the ROPS is not inhibited (on the SURV panel, the ROW/ROP pb-sw is ON).
In the case of a failure that affects landing performance and/or the availability of the thrust reversers, ROPS does not prevent runway excursion.
If DRY runway condition is set for WET PFC/GROOVED runway, ROPS does not prevent runway excursion.
In any case, if ROPS alerts are triggered, the flight crew must immediately apply the ROPS procedures.

ROW/ROP

Ident.: LIM-ROW_ROP-00016038.0008001 / 04 JUN 19

GPWS / PREDICTIVE GPWS ◁

Ident.: LIM-SURV-00019775.0001001 / 28 MAY 20
Applicable to: ALL

Aircraft navigation must not be based on the use of the terrain display .
The terrain display is intended to serve as a situation awareness tool only, and may not provide the accuracy on which to solely base terrain avoidance maneuvering.

The predictive GPWS ◁ functions should be inhibited (TERR pushbutton to OFF, on the GPWS panel) when the aircraft position is less than 15 NM from the airfield:
- For operations from/to runways not incorporated in the predictive GPWS database.
- For specific approach or departure procedures, which have previously been identified by the operator as potentially causing expected or spurious terrain alerts.

Note: *The decision to inhibit the predictive GPWS functions must not be based on flight crew judgement only.*

Only aircraft with Man-made Obstacle Function ◁ can display obstacles on ND and trigger alerts, based on a dedicated database which includes artificial obstacles worldwide.

USE OF MANUAL MAGNETIC INDICATORS (MMI)

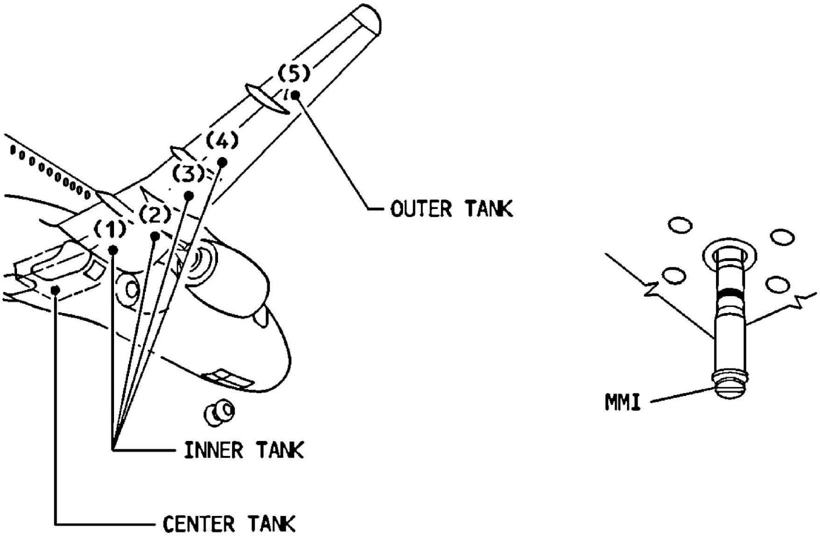
Ident.: EFB-LOD-FUL-C-00001679.0005001 / 23 JUN 15

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03211, 03266-03284, 03313-03710, 03733

GENERAL

Indicators are disposed as follows:

- five in each wing tank, four in inner tank and one in outer tank
- one in the center tank



TO DETERMINE AIRCRAFT ATTITUDE

Set ADIRS 1, 2, 3 to the NAV position.
On the LH or RH MCDU, press MCDU MENU pushbutton.
Select CFDSline key (LSK 4L).
Select SYSTEM REPORT/TEST line key (LSK 5L).
Select the line key adjacent to the FUEL indication.
On the MCDU control panel, push the NEXT PAGE key to display the FUEL Main Menu second page.
Select the line key adjacent to the INPUT PARAMETERS VALUES indication.
Use the Table given on the next page to determine the equivalent number and letter from PITCH and ROLL data.
Select RETURN line key (LSK 6L) until CFDS main menu appears.
Press MCDU MENU pushbutton.

PITCH	REF	ROLL	REF
Minus 1.5	1	**Minus 1.5**	A
Minus 1.0	2	**Minus 1.0**	B
Minus 0.5	3	**Minus 0.5**	C
0.0	4	**0.0**	D
Plus 0.5	5	**Plus 0.5**	E
Plus 1.0	6	**Plus 1.0**	F
Plus 1.5	7	**Plus 1.5**	G

Note: *1. This procedure can only be used if:*

- *The PITCH and ROLL data is taken from the ADIRS (identified by an “A” after the PITCH and ROLL title).*
- *The PITCH data displayed for the LEFT, CTR, and RIGHT is no more or less than 0.1 of each other.*
- *The ROLL data displayed for the LEFT, CTR, and RIGHT is no more or less than 0.1 of each other.*

2. The FQIS input parameters are not automatically updated. Use the NEXT PAGE control on the MCDU to cycle the pages to update the screen.

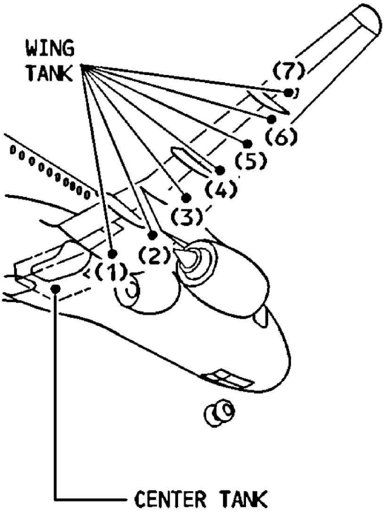
ACCESS PLATFORM..IN POSITION

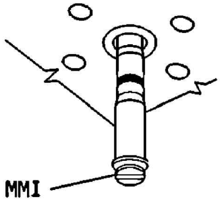
Ident.: EFB-LOD-FUL-C-00001679.0006001 / 23 JUN 15
Applicable to: MSN 03222-03229, 03294, 03761-03816

GENERAL

Indicators are disposed as follows :

- seven in each wing tank,
- one in the center tank





TO DETERMINE AIRCRAFT ATTITUDE

Set ADIRS 1, 2, 3 to the NAV position.
On the LH or RH MCDU, press MCDU MENU pushbutton.
Select CFDSline key (LSK 4L).
Select SYSTEM REPORT/TEST line key (LSK 5L).
Select the line key adjacent to the FUEL indication.
On the MCDU control panel, push the NEXT PAGE key to display the FUEL Main Menu second page.
Select the line key adjacent to the INPUT PARAMETERS VALUES indication.
Use the Table given on the next page to determine the equivalent number and letter from PITCH and ROLL data.
Select RETURN line key (LSK 6L) until CFDS main menu appears.
Press MCDU MENU pushbutton.

PITCH	REF	ROLL	REF
Minus 1.5	1	**Minus 1.5**	A
Minus 1.0	2	**Minus 1.0**	B
Minus 0.5	3	**Minus 0.5**	C
0.0	4	**0.0**	D
Plus 0.5	5	**Plus 0.5**	E
Plus 1.0	6	**Plus 1.0**	F
Plus 1.5	7	**Plus 1.5**	G

Note: *1. This procedure can only be used if :*
- *The PITCH and ROLL data is taken from the ADIRS (Make sure that the FQIS Status page does not show "NO DATA FROM ADIRU 1" and "NO DATA FROM ADIRU 2").*
- *The PITCH data displayed for the LEFT, CTR, and RIGHT is no more or less than 0.1 of each other.*
- *The ROLL data displayed for the LEFT, CTR, and RIGHT is no more or less than 0.1 of each other.*

2. The FQIS input parameters are not automatically updated every 5.50 s

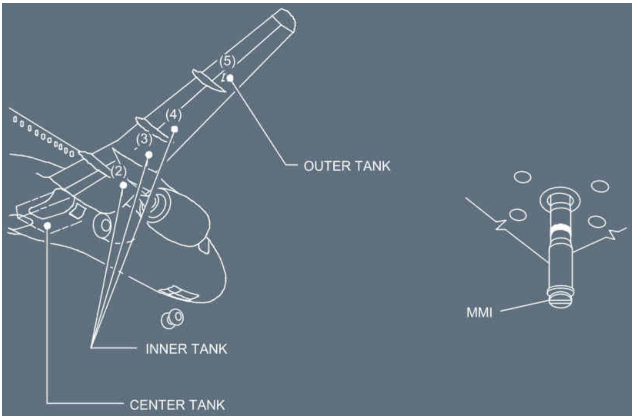
GENERAL

Indicators are installed as follows:
- Four in each wing tank: Three in the inner tank and one in the outer tank
- One in the center tank



TO DETERMINE AIRCRAFT ATTITUDE

Set ADIRS 1, 2, 3 to the NAV position.
On the LH or RH MCDU, press MCDU MENU pushbutton.
Select CFDS line key (LSK 4L).
Select SYSTEM REPORT/TEST line key (LSK 5L).
Select the line key adjacent to the FUEL indication.
On the MCDU control panel, push the NEXT PAGE key to display the FUEL Main Menu second page.
Select the line key adjacent to the INPUT PARAMETERS VALUES indication.
Use the Table given on the next page to determine the equivalent number and letter from PITCH and ROLL data.
Select RETURN line key (LSK 6L) until CFDS main menu appears.
Press MCDU MENU pushbutton.

PITCH	REF	ROLL	REF
Minus 1.5	1	**Minus 1.5**	A

TO DETERMINE FUEL QUANTITY IN THE OUTER TANK

MMI number 5...UNLOCK and WITHDRAW

The flight crew must withdraw the MMI slowly until the flight crew feels the magnetic attraction between the rod and float magnets.
Do not use force when withdrawing the MMI as this will disengage the float magnet from the rod magnet and bring the rod down onto the mechanical stop.

ROD GRADUATION (which aligns with bottom wing surface)..READ
MMI...IN PLACE and LOCKED
Use the table for the applicable aircraft wing side, aircraft attitude (grid square letter and number), and the MMI stick number 5, to find the volume of fuel in the outer tank (See below).
Multiply the result by the specific gravity to find the fuel weight.

Note: The manual magnetic indication accuracy is around 5 %.

N1 MODE THRUST CONTROL

Ident.: EFB-THR-N1-00004648.0004001 / 05 NOV 19

Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 04000-04192, 04389, 04563, 04773, 05345

In case of no EPR available, the thrust control automatically reverts to N1 mode (rated or degraded). *Refer to PRO-ABN-ENG ENG 1(2) EPR MODE FAULT (First Threshold)*.

If the rated N1 mode is lost on both engines, refer to the power management tables given on the following pages.

The herebelow table gives the N1 to be set in cruise to maintain M 0.78.

	FLIGHT LEVEL

GENERAL

Ident.: EFB-TOF-10-00022478.0001001 / 28 NOV 19
Applicable to: ALL

The takeoff performance optimization is the process which aims at obtaining:
- The maximum performance limited takeoff weight (MTOW (perf))
- The optimum takeoff thrust for a given weight.

The takeoff performance is optimized for a given runway, the associated obstacles, the flaps setting, the prevailing outside conditions (temperature, wind, and QNH) and the aircraft status.

The takeoff performance optimization process:
- Takes into account the parameters that affect takeoff performance
- Optimizes the parameters for which there is a possible range of values or settings

L2 The takeoff performance optimization process is made with the takeoff performance (T.O PERF) application.

TAKEOFF PARAMETERS

Ident.: EFB-TOF-10-00022479.0001001 / 28 NOV 19
Applicable to: ALL

The takeoff performance parameters are:

- The characteristics of the runway
  - L2 Declared lengths (TORA, TODA, ASDA)
  - Elevation
  - Slope
  - Obstacles.
- L1 The regulatory requirements
- The line up distances as applicable
- The outside conditions
  - L2 Outside Air Temperature (OAT)
  - Wind

    L3 Maximum tailwind is limited to a certified value. There is no maximum certified value for headwind, however a headwind higher than 40 kt brings no additional performance credit.
    As per regulation, the computation is based on 150 % of the entered tailwind, and 50 % of the entered headwind.
    A maximum crosswind component is associated with each runway condition.
    For more information on crosswind limitations, *Refer to LIM-AG-OPS Crosswind for Takeoff and Landing*.
    In addition, the flight crew applies a different thrust setting technique during the takeoff procedure when the crosswind component exceeds a threshold value, which may affect the calculation of the takeoff distance depending on the engine model installed on the aircraft.
    For more information on the takeoff procedure, *Refer to PRO-NOR-SOP-12 Takeoff - Takeoff Clearance*.
  - L2 QNH
  - Runway condition.
- L1 The aircraft configuration
  - L2 Aerodynamic configuration
  - Air conditioning setting
  - Anti-ice selection
  - Thrust setting.
- L1 The aircraft status
  - L2 MEL items
  - CDL items.

L1 - The takeoff speeds.

L2
- V1
- VR
- V2.

L1 The following parameters can be optimized:

- Aerodynamics configuration
- Air conditioning
- Thrust setting

L2
- TOGA
- FLEX
- Derate levels.

L1 - Takeoff speeds.

L2 Among the takeoff performance parameters that can be optimized, the takeoff speeds optimization has the largest potential for gain of takeoff weight. The range for optimization varies from 0.84 to 1.0 for V1/VR ratio and from 1.13 to 1.4 for V2/VS1G ratio.

Intentionally left blank

TOGA THRUST

Ident.: EFB-TOF-20-10-00022493.0001001 / 28 NOV 19
Applicable to: ALL

TOGA is the maximum thrust certified for takeoff.
When all engines are operative, the TOGA thrust rating must not be used more than 5 min.
In the case of one engine out, the TOGA thrust rating may be used for a maximum of 10 min.

The flight crew must use TOGA thrust for takeoff if at least one of the following conditions applies:
- Maximum power is required
- Performance reasons
- Flexible takeoff and derated takeoff are not permitted.

Intentionally left blank

General

GENERAL

Ident.: EFB-TOF-20-20-10-00022494.0001001 / 28 NOV 19
Applicable to: ALL

The actual takeoff weight of the aircraft is often lower than the maximum regulatory takeoff weight. In this case, it may be possible to takeoff at a thrust less than the maximum takeoff thrust. This allows to increase the engine life, improve the engine reliability and reduce the maintenance costs.

Two categories of takeoff at reduced thrust exist:
- The use of flexible temperature concept referred to as flexible takeoff
- The use of a fixed derated thrust level referred to as derated takeoff.

Intentionally left blank

Flexible Takeoff

FLEXIBLE TAKEOFF DEFINITION

Ident.: EFB-TOF-20-20-20-00022495.0001001 / 28 NOV 19
Applicable to: ALL

When the actual takeoff weight is lower than the maximum performance limited takeoff weight, the aircraft may comply with the regulatory requirements with a reduced thrust, called flexible takeoff thrust.
This takeoff operation is the FLEX takeoff.

FLEXIBLE TAKEOFF PRINCIPLE

Ident.: EFB-TOF-20-20-20-00022497.0001001 / 28 NOV 19

Applicable to: ALL

The FLEX takeoff principle is based on the change in maximum available thrust with OAT.
The maximum performance limited takeoff weight depends on the maximum available takeoff thrust, therefore it is possible to determine a temperature at which the actual takeoff weight would be limited by performance.
This temperature is referred to as TFLEX (Flex Temperature).

Flexible Takeoff Principle

FLEXIBLE TAKEOFF LIMITATIONS

Ident.: EFB-TOF-20-20-20-00022498.0002001 / 28 NOV 19

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098, 10949-11597**

Takeoff at reduced thrust, so-called as FLEX takeoff, is allowed only if the airplane meets all performance requirements at the takeoff weight, with the operating engines at the thrust available for the flexible temperature (TFLEX).

TFLEX cannot be:
- Higher than TMAXFLEX.

L2 For more information on TMAXFLEX, *Refer to LIM-ENG Flex Takeoff*.

L1
- Lower than the flat rating temperature (TREF).
- Lower than the actual OAT.

TFLEX
Possible Range
25% of Max
Takeoff Thrust
TMAXFLEX
OAT
TREF
Actual OAT

FLEX takeoff is not permitted on contaminated runways.
Some items listed in the MEL and CDL do not permit a flexible takeoff.

L2 The operator should check the maximum thrust (TOGA) by:
- Performing full-rated takeoffs at regular intervals, in order to detect a reduced EGT margin, or
- Maintaining an adequate engine monitoring program, in order to follow-up on the engine parameters.

Derated Takeoff (If Installed)

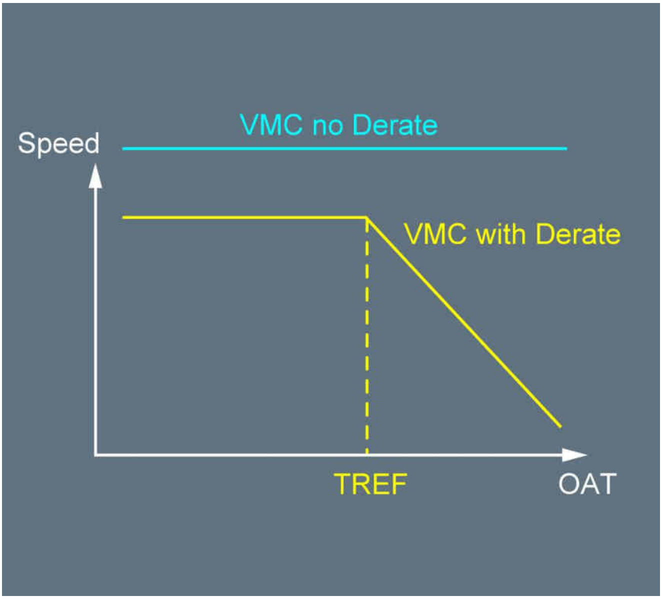
DERATED TAKEOFF PRINCIPLE

Ident.: EFB-TOF-20-20-30-00022500.0001001 / 28 NOV 19
Applicable to: ALL

The derated takeoff enables to improve the takeoff performance if the TOW is limited by VMCG. VMCG limitation usually occurs on short and/or contaminated runways. The principle is to impose a lower engine rating to benefit from lower minimum control speeds.

L2 In the case of derated takeoff, the minimum control speeds (VMCG and VMCA) are decreased because:
- The derated thrust is lower than the maximum takeoff thrust
- The effect of temperature on maximum available thrust is taken into account.

Derated Takeoff Principle



VMCG LIMITING

VMCG only has an impact on the ASD that includes an acceleration and a deceleration phase. The decrease in VMCG allows to use lower V1 values in the speed optimization, which shortens both the acceleration and the deceleration distances.

The weight decrement linked to the derated thrust is largely compensated by the benefit of shorter ASD. As a consequence, if takeoff performance is limited by the VMCG limited weight, an overall improvement can be achieved by derating.

VMCA LIMITING

The penalizing effect on climb gradient of the decrease in thrust outweighs the advantage of a lower VMCA.
Therefore derated takeoff would not improve the takeoff weight if VMCA limited.

DERATED TAKEOFF LIMITATION

Ident.: EFB-TOF-20-20-30-00022501.0001001 / 28 NOV 19
Applicable to: ALL

It is not permitted to combine a derated takeoff and a FLEX takeoff.
When a derated takeoff is performed, the selection of full takeoff thrust, by setting thrust levers to TOGA, is not permitted below the speeds specified in the "Engine Failure After V1 - Continued Takeoff Operating Technique". The only exception is the Recovery Technique at takeoff after the penetration of unforecast windshear.

L2 For more information on the specified speeds, *Refer to FCTM/PR-AEP-ENG Engine Failure after V1*.

DESCRIPTION

Ident.: EFB-TOF-30-10-00022480.0001001 / 28 MAY 20
Applicable to: ALL

A runway is dry when its surface is:
- Free of visible moisture
- Not contaminated.

PERFORMANCE CALCULATION

Ident.: EFB-TOF-30-10-00022481.0001001 / 28 NOV 19
Applicable to: ALL

Takeoff performance is calculated without the benefit of thrust reversers, as per regulation.
Flexible takeoff and derated takeoff are allowed for a takeoff from a dry runway.

Intentionally left blank

DESCRIPTIONS

Ident.: EFB-TOF-30-20-00022482.0001001 / 15 NOV 21
Applicable to: ALL

WET RUNWAY

A runway is considered as wet, when the surface is covered by any visible moisture or water up to and including 3 mm (1/8 in) depth. When the water film does not exceed 3 mm (1/8 in), there is no significant danger of hydroplaning.

Note: *1. A damp runway is considered wet, regardless of whether or not the surface has a shiny appearance.*
2. A runway is considered slippery wet when a significant portion of its surface does not comply with the applicable minimum friction criteria.

PERFORMANCE CALCULATION

Ident.: EFB-TOF-30-20-00022483.0001001 / 15 NOV 21
Applicable to: ALL

Takeoff performance on a wet runway can be calculated with the benefit of thrust reversers.
However, it is not allowed to take off at a weight higher than the weight on dry runway.
Flexible takeoff and derated takeoff are allowed for a takeoff from a wet runway.

L2 For information on contaminants equivalent to wet runway, *Refer to EFB-TOF-30-30 Performance Calculation*.

L1 For runways that have portions declared as slippery wet, performance should be calculated with the Slippery wet runway condition option, or, if not available, Dry snow 10 mm (2/5").

Note: *Flexible takeoff computation is not available for Dry snow 10 mm (2/5").*

Intentionally left blank

DESCRIPTIONS

Ident.: EFB-TOF-30-30-00022484.0001001 / 15 NOV 21
Applicable to: ALL

A runway is contaminated when a significant portion (depending on the applicable regulation) of its surface is covered with:

- A layer of fluid contaminant not considered as thin
- A hard contaminant.

FLUID CONTAMINANT

In terms of performance, a contaminated runway is a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8 in). The fluid contaminant can be either:

- Dry snow
- Wet snow
- Standing water
- Slush.

Fluid Contaminants reduce friction forces, and cause:

- Precipitation drag
- Hydroplaning.

L2 Fluid contaminants descriptions:

- Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
- Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
- Standing water occurs due to heavy rain and/or not sufficient runway drainage. Standing water has a depth of more than 3 mm (1/8 in).
- Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures of approximately 5 °C, and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).

L1 HARD CONTAMINANT

In terms of performance, a contaminated runway is a runway covered by a hard contaminant that can be either:

- Compacted snow
- Ice (Cold and Dry)
- Wet ice.

Hard contaminants only reduce friction forces.

L2 Hard contaminants descriptions:

- Compacted snow: the maintenance personnel use a snow groomer to compress the snow on a runway in order to obtain a hard surface
- Ice (Cold and Dry): situation in which ice occurs on the runway in cold and dry conditions
- Wet ice: when the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

PERFORMANCE CALCULATION

Ident.: EFB-TOF-30-30-00022485.0001001 / 03 NOV 22
Applicable to: ALL

Takeoff performance on contaminated runways can be calculated with the benefit of thrust reversers. However, it is not allowed to take off at a weight higher than the weight on a dry runway.

For fluid contaminants, takeoff performance data are provided up to the following depths:
- Dry snow: 100 mm (4 in)
- Wet snow: 30 mm (6/5 in)
- Standing water: 13 mm (1/2 in)
- Slush: 13 mm (1/2 in).

Performance computations for depths above the real depth of contamination on the runway may provide results that are better than the real aircraft performance, because of the excess drag that improves the stopping distance. Airbus recommends to retain the takeoff speeds and thrust setting of the lower MTOW (perf) resulting from two computations: one with the depth above the reported depth and one with the depth below.

Note: *The Airbus EFB TAKEOFF PERF application automatically makes this double computation.*

L2 The following assumptions are considered for the calculation:
- The contaminant covers the entire length of the runway in a layer that has a uniform depth and density
- The friction coefficient is based on studies, and verified by tests
- The screen height at the end of the takeoff segment is 15 ft, instead of 35 ft.

L1 Derated takeoff is allowed on contaminated runways.

EQUIVALENCES

In terms of performance:
- A fluid contamination is equivalent to wet, up to a maximum depth of 3 mm (1/8 in) of:
  - Dry snow
  - Wet snow
  - Standing water
  - Slush.
- Frost is equivalent to wet, unless a lower runway performance code is reported
- Compacted snow with OAT above -15 °C is equivalent to Dry snow 10 mm (2/5 in)

  Note: *Compacted snow is appropriate for OAT at or below -15 °C.*

- Dry snow over compacted snow is equivalent to dry snow of appropriate depth
- Wet snow over compacted snow is equivalent to wet snow of appropriate depth.

DOWNGRADE

- **If both runway condition and RWYCC inputs are available in the T.O PERF application:**
  The flight crew enters the downgraded RWYCC and uses the takeoff computation results without additional restriction.
- **If only the runway condition is available in the T.O PERF application:**
  - **For a runway covered by a hard contaminant, or a fluid contaminant with a depth of 3 mm (1/8 in) or less:**

    In the case of a downgrade to:
    - RWYCC 4, the flight crew computes the takeoff performance with Compacted snow
    - RWYCC 3, the flight crew computes the takeoff performance with Dry snow 10 mm (2/5 in)
    - RWYCC 2, the computation with any depth of Slush or Standing water may not be conservative. The flight crew should delay takeoff
    - RWYCC 1, the flight crew computes the takeoff performance with Ice cold & dry.
  - **For a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8 in):**
    In the case of any downgrade, the flight crew should delay takeoff.

RESTRICTIONS

Ident.: EFB-TOF-30-30-00022486.0001001 / 28 NOV 19
Applicable to: ALL

FLEX takeoff is not permitted on contaminated runways.
Dispatch from a runway covered with wet ice is not permitted, unless a specific method for performance assessment has been established by the operator.
Refer to the AFM for further guidance.

TAKEOFF WITH MEL OR CDL ITEM

Ident.: EFB-TOF-40-00022487.0001001 / 28 NOV 19
Applicable to: ALL

The aircraft can be dispatched with deferred MEL or CDL items.

MEL or CDL items that affect takeoff performance are:
- MEL items that reduce braking capabilities (brakes, spoilers, thrust reversers)
- MEL items that have an effect on thrust available (engine anti-ice valve stuck open)
- MEL items that may lead to a reduced systems efficiency (rudder actuator, DFS, EDP)
- CDL items that increase aircraft drag (seals, fairings).

L2 CDL items are divided in two categories: negligible and non-negligible items.
If the number of negligible CDL items is less or equal to three, no penalty applies.
If the number of negligible CDL items is more than three, a drag increase for each item is applied.

Intentionally left blank

TAKEOFF RECOMMENDATIONS

Ident.: EFB-TOF-50-00022489.0001001 / 28 NOV 19
Applicable to: ALL

TAKEOFF CONFIGURATION

As a general rule, CONF 1+F gives better performance on long runways (better climb gradient), whereas CONF 3 gives better performance on short runways (shorter takeoff distances).
Sometimes, other parameters, such as obstacles can interfere. In this case, a compromise between climb and runway performance is requested, making CONF 2 the optimum configuration for takeoff.
Environmental takeoff conditions may also impact the choice of the takeoff configuration.
The following takeoff configuration is then recommended:

OUTSIDE CONDITIONS	FLAPS SETTINGS	OBJECTIVE
Dry or wet, well-paved runway	Use the flaps setting that provides the optimum performance. If takeoff weight is not limited by performance, consider using the higher flaps setting. *Note:* *Corresponds to OPT CONF selection in T.O PERF*	To extend engine life and save maintenance costs
High altitude takeoff	Use CONF 2 or CONF 3	To improve comfort
Badly-paved runway, or accelerate stop distance limited runway	Use CONF 2 or CONF 3	To improve comfort and stopping distance

FLEXIBLE TAKEOFF

Flexible takeoff is the recommended method for takeoff at reduced thrust on dry and wet runways.
The highest flexible temperature (TFLEX) extends engine life and saves maintenance costs.
However, if a high TFLEX is reduced by a few degrees only, the engines are not significantly affected.
The highest TFLEX will usually be obtained at the lowest flap setting. However, a higher flaps setting provides a lower decision speed (V1) and more comfort.
To extend engine life and to save maintenance costs, the use of flaps setting that provides the highest TFLEX is recommended. However, when the difference (in terms of TFLEX) between two configurations is low, the highest of both takeoff configurations is preferable.

IN-FLIGHT PERFORMANCE CALCULATION

Ident.: EFB-IFT-10-00022556.0001001 / 28 NOV 19
Applicable to: ALL

Performance data are split by flight phases: climb, cruise, descent, and holding.
In-flight performance calculation is made with the in-flight performance application (IN-FLT PERF).

Intentionally left blank

General

GENERAL

Ident.: EFB-IFT-20-10-10-00022557.0001001 / 28 NOV 19
Applicable to: ALL

The climb phase starts at the end of takeoff and ends at the initial cruise level.

The only available thrust option is:
- CLB: maximum climb thrust.

Intentionally left blank

Climb Thrusts

MAXIMUM CLIMB THRUST

Ident.: EFB-IFT-20-10-20-00022560.0001001 / 28 NOV 19

Applicable to: ALL

The “Maximum Climb” thrust rating is the maximum thrust approved for normal climb.

The FADEC commands this rating when the thrust lever is on the CL detent and the flight crew has selected CLB in the CLB THR list of the FMS ACTIVE/PERF page.

Intentionally left blank

Speeds

ECONOMIC MACH NUMBER (ECON MACH)

Ident.: EFB-IFT-20-20-10-00022561.0001001 / 28 NOV 19
Applicable to: ALL

COST INDEX

The Cost index (CI) is defined as the ratio between Cost of Time per time unit (CT) and Cost of Fuel per mass unit (CF).
The CI value is expressed in kilograms per minute (kg/min), or hundreds of pounds per hour (100 lbs/hr).
The purpose of the CI concept is to reduce Direct Operating Costs (DOC).

ECON MACH

For a given CI, ECON Mach is defined as the Mach for which DOC are minimum.

LONG RANGE CRUISE SPEED (LRC)

Ident.: EFB-IFT-20-20-10-00022562.0001001 / 28 NOV 19
Applicable to: ALL

The Long Range Cruise speed (LRC) is defined as the Mach number for which the specific range is equal to 99 % of the maximum specific range.

L2 For more information, *Refer to DSC-22_20-40-20 Cost Index (CI)*.

FIXED SPEED

Ident.: EFB-IFT-20-20-10-00022563.0001001 / 28 NOV 19
Applicable to: ALL

The fixed speed is either a Mach or a CAS.

TURBULENCE SPEED

Ident.: EFB-IFT-20-20-10-00022564.0001001 / 28 NOV 19
Applicable to: ALL

Turbulence speeds are recommended when the aircraft flies in a turbulent atmosphere.
For recommended turbulence speed, *Refer to PRO-ABN-MISC [QRH] General*.

MAXIMUM SPEED

Ident.: EFB-IFT-20-20-10-00022565.0001001 / 28 NOV 19
Applicable to: ALL

Maximum speed is either:

- The Maximum Operating Mach (MMO), or
- The Maximum Operating speed (VMO), or
- The speed limited by the available thrust.

L2 For more information on Maximum Speed, *Refer to LIM-AG-SPD Maximum Operating Speed VMO/MMO*.

Altitude/Ceilings

DEFINITIONS

Ident.: EFB-IFT-20-20-20-00022566.0001001 / 28 NOV 19
Applicable to: ALL

OPTIMUM ALTITUDE

The optimum altitude (OPT ALT) is the altitude at which the SR is maximum.

REC MAX

Maximum altitude is defined as the lower of:
- Maximum altitude at maximum cruise thrust in level flight
- Maximum altitude at maximum climb thrust with 300 ft/min vertical speed
- Maximum certified altitude
- 1.3 g buffet limited altitude.

ALTITUDE OPTIMIZATION

Ident.: EFB-IFT-20-20-20-00022567.0001001 / 28 NOV 19
Applicable to: ALL

The optimum altitude definition depends on the cruise type.
The optimum altitude (OPT) displayed on the FMS-PERF page and the optimum altitude (OPTIMUM ALT) determined by the EFB IN-FLT PERF Cruise computation for a given Cost Index (CI) are the result of a minimum cost analysis. To determine these optimum altitudes, both the FMS and IN-FLT PERF calculate the value of the Cost Function (CF) based on the CI. The altitude that provides the lowest value for the CF is displayed as OPT on the FMS-PERF page and as OPTIMUM ALT on the EFB IN-FLT PERF.
These optimum altitude computations take into account a large number of parameters. The FMS and the EFB consider some of these parameters in a different manner. Therefore, OPT on the FMS and OPTIMUM ALT on the EFB may differ.
L2 The main contributor to any difference between OPT on the FMS and OPTIMUM ALT on the EFB is the wind.

Intentionally left blank

GENERAL

Ident.: EFB-IFT-20-30-00022568.0001001 / 28 NOV 19
Applicable to: ALL

The descent phase starts at the top of descent and ends at landing or level off.
In the case of an emergency descent, MMO/VMO is the best speed profile as it gives high rate of descent, which can be increased by extending the speed brakes, if needed.

Intentionally left blank

GENERAL

Ident.: EFB-IFT-20-40-00022569.0002001 / 05 MAY 22

Intentionally left blank

ONE ENGINE INOPERATIVE STRATEGIES

Ident.: EFB-IFT-30-00022570.0001001 / 28 NOV 19
Applicable to: ALL

For more information about One Engine Inoperative Strategies, *Refer to FCTM/PR-AEP-ENG Engine Failure During Cruise*.

LONG RANGE CRUISE SPEED

Ident.: EFB-IFT-30-00022571.0001001 / 28 NOV 19
Applicable to: ALL

If the EO mode of the FMS is active, the FMS takes the engine failure into account to compute the EO-LRC speed/ Mach.

EO MAX ALTITUDE

Ident.: EFB-IFT-30-00022572.0001001 / 28 NOV 19
Applicable to: ALL

The FMS Engine Out Maximum (EO MAX) altitude is a precomputed value, function of the aircraft gross weight and DISA, displayed on all the PERF pages if one engine is inoperative.

L2 **EO MAX** altitude respects the following criteria:
- It can be flown with LRC speed
- It can be held in level flight with:
  - The operating engine at "Maximum Continuous Thrust" rating
  - The failed engine in windmilling
  - Anti-ice OFF
- It can be reached before buffeting with a margin of 0.3 g
- It is less than the maximum certified altitude.

HOLDING

Ident.: EFB-IFT-30-00022573.0002001 / 05 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

In CONF CLEAN, the standard EO holding speed is the Green Dot + 20 kt.

Intentionally left blank

GENERAL

Ident.: EFB-LDG-10-00022590.0001001 / 15 NOV 21
Applicable to: ALL

The landing performance calculation enables:
- At dispatch, to check that the aircraft can land at destination for the predicted conditions, in compliance with the regulatory requirements
- During flight, to check that the aircraft can land at destination for the actual conditions.

L2 The landing performance calculation is made with the landing performance (LDG PERF) application.

LANDING PARAMETERS

Ident.: EFB-LDG-10-00022591.0001001 / 28 NOV 19
Applicable to: ALL

The landing performance parameters are:

- The characteristics of the runway
  - L2 Landing Distance Available (LDA)
  - Elevation
  - Slope
  - Missed approach gradient.
- L1 The regulatory requirements
- The outside conditions
  - L2 Wind

    L3 As per regulation, the computation is based on 150 % of the entered tailwind, and 50 % of the entered headwind.

    The crosswind component does not affect the calculation of the landing distance. However, a maximum crosswind component is associated with each runway condition.

    For more information about crosswind limitation, *Refer to LIM-AG-OPS Crosswind for Takeoff and Landing*.
  - L2 Outside Air Temperature (OAT)
  - Sea level atmospheric pressure (QNH)
  - Icing conditions (anti-ice selection)
  - Runway condition, or landing performance level.
- L1 The aircraft configuration
  - L2 Landing Weight (LW)
  - Aerodynamic configuration
  - Air conditioning setting
  - Aircraft CG position
  - Approach speed and go-around speed.
- L1 The aircraft status.
  - L2 MEL items
  - CDL items
  - Abnormal and emergency configuration (ABN EMER) for in-flight computation only.

L1 The following parameters can be optimized:

- Aerodynamics configuration
- Go-around speed.

L2 For more information about the go-around speed, *Refer to EFB-LDG-20 Landing Speeds*.

Intentionally left blank

LANDING SPEEDS

Ident.: EFB-LDG-20-00022592.0001001 / 28 NOV 19
Applicable to: ALL

LOWEST SELECTABLE SPEED (VLS)

VLS is the lowest selectable speed. VLS is used to determine the Final Approach Speed (VAPP) in normal conditions.
For more information about VLS, *Refer to DSC-22_10-50-20 Characteristic Speeds*.

REFERENCE SPEED (VREF)

VREF is equal to the VLS of CONF FULL. VREF is used to determine the Final Approach Speed (VAPP) when a system failure affects the landing performance.
For more information about VREF, *Refer to DSC-22_10-50-50 Other Speeds*.

FINAL APPROACH SPEED (VAPP)

VAPP is the speed of the aircraft when crossing the runway threshold. The flaps/slats are in the landing configuration, and the landing gears are extended.
For more information about VAPP, *Refer to DSC-22_10-50-50 Other Speeds*.

GO-AROUND SPEED

In the case of a missed approach, the go-around climb gradient is calculated at the go-around speed.
The standard go-around speed is 1.23 VS1G of the go-around configuration. For approaches with a decision height at or above 200 ft, where approach climb performance is found restrictive, the go-around speed can be increased up to a maximum limit. For more information about maximum go-around acceleration speed, *Refer to AFM/PERF-LDG Approach Climb and Landing Climb*.

LANDING DISTANCES DEFINITIONS

Ident.: EFB-LDG-20-00022593.0001001 / 15 NOV 21
Applicable to: ALL

REQUIRED LANDING DISTANCE

The RLD is the regulatory reference to be used for dispatch landing performance computation.

The RLD is the factored certified landing distance based on:
- Maximum manual braking initiated immediately after main gear touchdown
- Prompt selection of max reverse thrust, maintained to 70 kt, and idle thrust to full stop (when reverse thrust is taken into account)
- Antiskid system and all ground spoilers operative
- The regulatory dispatch factor.

Note: *The RLD calculation considers the effect of the MEL/CDL items that affect the landing performance.*

IN-FLIGHT LANDING DISTANCE

The In-Flight Landing Distance reflects the performance achievable in a typical operational landing without margin.

The In-Flight Landing Distance calculation assumes:
- An airborne phase of 7 s from threshold to touchdown
- In the case of manual braking: maximum manual braking initiated immediately after main gear touchdown
- In the case of autobrake: normal system delays in braking activation
- Antiskid system and all ground spoilers operative
- Prompt selection of max reverse thrust, maintained to 70 kt, and idle thrust to full stop (when reverse thrust is taken into account).

Note: *The In-Flight Landing Distance calculation considers the effect of the inoperative system(s) following:*

- *An MEL/CDL dispatch that affects the landing performance*
- *An in-flight failure (ECAM alert) that affects the landing performance.*

Note: *The In-Flight Landing Distance fulfills the requirements of the Landing Distance at Time of Arrival (LDTA) described in Air Ops AMC1 CAT.OP.MPA.303(e).*

FACTORED IN-FLIGHT LANDING DISTANCE

The definition of the In-Flight Landing Distance does not include any margin. The In-Flight Landing Distance is a realistic distance achievable in nominal conditions, i.e. the actual conditions during the landing are those used for the computation.

It is recommended to apply an appropriate margin to the In-Flight Landing Distance (either determined with or without failure) in order to cover:
- The variability in flying techniques (e.g. flare execution, delay in application of the deceleration means)
- Unexpected conditions at landing (e.g. real runway friction vs. reporting, turbulence, crosswind).

L2 The FLD is defined as:
- The In-Flight Landing Distance multiplied by a Factor, or
- The In-Flight Landing Distance plus an Increment.

L1 It is the airlines responsibility to define the margins (and their applicability) to apply on top of the In-Flight Landing Distance.
The recommended margin is a Factor of 1.15 on the In-Flight Landing Distance. In an emergency situation, the flight crew may decide to disregard this margin.

ROW ◁ LANDING DISTANCE

The ROW ◁ landing distance is calculated below 400 ft based on:
- The detected runway
- The current outside condition (e.g QNH, Temperature…)
- Dry and wet runway conditions
- A realistic manual or automatic landing, normal flare, and de-rotation technique
- Maximum braking
- IDLE REV, when runway condition/braking action is assumed to be DRY-6
- MAX REV, when runway condition/braking action is assumed to be WET-5.

Intentionally left blank

DRY RUNWAY

Ident.: EFB-LDG-30-00022594.0001001 / 28 MAY 20
Applicable to: ALL

A runway is dry when its surface is:
- Free of visible moisture
- Not contaminated.

WET RUNWAY

Ident.: EFB-LDG-30-00022595.0001001 / 15 NOV 21
Applicable to: ALL

A runway is considered as wet, when the surface is covered by any visible moisture or water up to and including 3 mm (1/8 in) depth. When the water film does not exceed 3 mm (1/8 in), there is no significant danger of hydroplaning.

Note: 1. *A damp runway is considered wet, regardless of whether or not the surface has a shiny appearance.*
2. *A runway is considered slippery wet when a significant portion of its surface does not comply with the applicable minimum friction criteria.*

CONTAMINATED RUNWAY

Ident.: EFB-LDG-30-00022596.0001001 / 03 NOV 22
Applicable to: ALL

A runway is contaminated when a significant portion (depending on the applicable regulation) of its surface is covered with:
- A layer of fluid contaminant not considered as thin
- A hard contaminant.

DESCRIPTION OF FLUID CONTAMINANTS

In terms of performance, a contaminated runway is a runway covered by a fluid contaminant with a depth of more than 3 mm (1/8 in). The fluid contaminant can be either:
- Dry snow
- Wet snow
- Standing water
- Slush.

Fluid Contaminants reduce friction forces, and cause:
- Precipitation drag
- Hydroplaning.

L2 Fluid contaminants descriptions:
- Dry snow is snow that, if compacted by hand, does not stay compressed when released. The wind can blow dry snow. The density of dry snow is approximately 0.2 kg/l (1.7 lb/US Gal).
- Wet snow is snow that, if compacted by hand, stays compressed when released, and with which snowballs can be created. The density of wet snow is approximately 0.4 kg/l (3.35 lb/US Gal).
- Standing water occurs due to heavy rain and/or not sufficient runway drainage. Standing water has a depth of more than 3 mm (1/8 in).
- Slush is snow soaked with water, which spatters when stepped on firmly. Slush occurs at temperatures of approximately 5 °C, and has a density of approximately 0.85 kg/l (7.1 lb/US Gal).

L1 DESCRIPTION OF HARD CONTAMINANTS

In terms of performance, a contaminated runway is a runway covered by a hard contaminant that can be either:
- Compacted snow
- Ice (Cold and Dry)
- Wet ice.

Hard contaminants only reduce friction forces.

L2 Hard contaminants descriptions:
- Compacted snow: the maintenance personnel use a snow groomer to compress the snow on a runway in order to obtain a hard surface
- Ice (Cold and Dry): situation in which ice occurs on the runway in cold and dry conditions
- Wet ice: when the ice on a runway melts, or there are loose/fluid contaminants on top of the ice, the ice is referred to as "wet ice". When there is wet ice on a runway, braking and directional control are difficult or not possible, because the runway surface is very slippery.

L1 LANDING PERFORMANCE CALCULATION

L2 COMPUTATION ASSUMPTIONS

The following assumptions are considered for the calculation:
- The contaminant covers the entire length of the runway
- For fluid contaminants, the landing distance calculation does not take credit of the precipitation drag.

L1 EQUIVALENCES

In terms of performance:
- A fluid contamination is equivalent to wet, up to a maximum depth of 3 mm (1/8 in) of:
  - Dry snow
  - Wet snow
  - Standing water
  - Slush.
- Frost is equivalent to wet, unless a lower runway performance code is reported
- Slippery wet is equivalent to Dry snow
- Compacted snow with OAT above -15 °C is equivalent to Dry snow

Note: Compacted snow is appropriate for OAT at or below -15 °C.

- Dry snow over compacted snow is equivalent to Dry snow
- Wet snow over compacted snow is equivalent to Wet snow.

Note:
- *In the case of a downgraded RWYCC for dispatch computation, Airbus recommends to perform the landing computation with a contaminant included in this RWYCC's category in the RCAM.*
- *In the case of a downgraded or upgraded RWYCC, the flight crew should use the recommendations applicable to in-flight performance calculation. For more information, Refer to FCTM/LANDING PERFORMANCE / DOWNGRADED OR UPGRADED RWYCC.*

RESTRICTIONS

For maximum depth of fluid contaminants, *Refer to EFB-LDG-30 Runway Condition Assessment Matrix for Landing*.
Dispatch to a runway covered with wet ice is not permitted, unless a specific method for performance assessment has been established by the operator.
Refer to the AFM for further guidance.

RUNWAY CONDITION ASSESSMENT MATRIX FOR LANDING

Note: Refer for FCOM LIM-AFS chapter for Automatic Approach, Landing and Rollout limitations.

GENERAL

Ident.: EFB-LDG-40-00022598.0001001 / 28 NOV 19
Applicable to: ALL

LANDING PERFORMANCE CALCULATION

The landing performance calculation is made with the landing performance (LDG PERF) application, with the computation type set to DISPATCH.

REQUIREMENT ON THE LANDING DISTANCE

The Landing Distance Available (LDA) at destination must be at least equal to the Required Landing Distance (RLD) for the planned landing weight.

REQUIREMENT ON THE GO-AROUND PERFORMANCE

The go-around climb gradient must be at least equal to:
- 2.1 %
- The gradient published in the airport approach chart.

Note: *EU-OPS requires a minimum go-around climb gradient of 2.5 % for instrument approaches with decision heights below 200 ft.*

DISPATCH ON DRY RUNWAY

Ident.: EFB-LDG-40-00022599.0001001 / 28 NOV 19
Applicable to: ALL

Landing performance is calculated without the benefit of thrust reversers, as per regulation.
L2 For information, the AFM publishes the autoland landing distance increments on dry runways.

DISPATCH ON WET RUNWAY

Ident.: EFB-LDG-40-00022600.0001001 / 28 NOV 19
Applicable to: ALL

Landing performance is calculated without the benefit of thrust reversers, as per regulation.
The RLD for a wet runway is the RLD for the dry runway multiplied by 1.15.

DISPATCH ON CONTAMINATED RUNWAY

Ident.: EFB-LDG-40-00022601.0001001 / 28 NOV 19
Applicable to: ALL

Landing performance can be calculated with the benefit of the thrust reversers.
For operators complying with EU-OPS regulation, the landing weight on a contaminated runway cannot exceed the landing weight on a wet runway.

DISPATCH WITH MEL OR CDL ITEM

Ident.: EFB-LDG-40-00022602.0001001 / 28 NOV 19
Applicable to: ALL

The aircraft can be dispatched with deferred MEL or CDL items. In this case, the LDA must be at least equal to the RLD calculated with the applicable MEL or CDL item selected.

MEL or CDL items that affect landing performance are:
- MEL items that reduce braking capabilities (brakes, spoilers, thrust reversers if applicable)
- MEL items that have an impact on thrust available for go-around (engine anti-ice valve stuck open)
- CDL items that increase aircraft drag (seals, fairings).

L2 CDL items are divided in two categories: negligible and non-negligible items.
If the number of negligible CDL items is less or equal to three, no penalty applies.
If the number of negligible CDL items is more than three, a drag increase for each item is applied.

IN-FLIGHT LANDING DISTANCE CROSSCHECK

Ident.: EFB-LDG-40-00022603.0001001 / 15 NOV 21
Applicable to: ALL

The FLD may, in some cases, and particularly on contaminated runway, exceed the RLD considered at dispatch.
The requirements at dispatch remain unchanged and are based on the RLD. It is however recommended to make a preliminary calculation of the FLD at dispatch.
Based on this crosscheck, the crew only need to perform a computation during Descent Preparation in case of changes since dispatch.
If the FLD exceeds the LDA at destination, the Operator may limit the planned weight at destination by the maximum between the RLD and the FLD. The Operator may also consider suitable destination alternates.

ROW ◁ LANDING DISTANCE CROSSCHECK

Ident.: EFB-LDG-40-00022715.0001001 / 28 MAY 20
Applicable to: ALL

The ROW ◁ landing distance may, in some cases, exceed the RLD considered at dispatch.
If the conditions remain unchanged, the flight crew will not be authorized to initiate an approach (unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP ◁).
As a consequence, the dispatch conditions should be adapted in order to prevent a ROW ◁ alert being triggered.

REQUIRED LANDING DISTANCE AT RIO SANTOS DUMONT (SBRJ/SDU)

GENERAL

Ident.: EFB-LDG-50-00022605.0001001 / 15 NOV 21
Applicable to: ALL

During flight, the flight crew performs a landing performance computation if the landing conditions changed compared with the landing performance computation at dispatch, or with a previous computation (e.g. runway, weather conditions, in-flight failure affecting performance, diversion).
The landing performance calculation is made with the landing performance (LDG PERF) application, with the computation type set to IN-FLIGHT.
The landing distance used for this computation is the FLD. The flight crew uses the RCAM to determine the landing performance level.
If the aircraft has been dispatched with deferred MEL or CDL items, the In-Flight Landing Distance and FLD must be calculated with the applicable MEL or CDL items selected.
In an emergency situation, the flight crew may decide to disregard the FLD. In this case the flight crew must check that the In-Flight Landing Distance is shorter than the LDA at the destination or diversion airport.

L2 For more information on In-Flight Landing Distances, *Refer to EFB-LDG-20 Landing Distances Definitions*.

LANDING PERFORMANCE WITHOUT IN-FLIGHT FAILURE

Ident.: EFB-LDG-50-00022606.0001001 / 28 NOV 19
Applicable to: ALL

LANDING PERFORMANCE CALCULATION

The flight crew enters the expected landing conditions and calculates the landing performance.

FLAPS LEVER POSITION

The FLAPS lever position for landing is at flight crew's discretion.

VAPP DETERMINATION

VAPP is calculated by the FMS and is displayed on the APPR panel of the FMS PERF page.

L2 The VAPP is calculated by the FMS as the maximum of:
- VMCL + 5 kt
- 1.23*VS1G + APPR COR.

  APPR COR is the highest of:
  - 5 kt in case of A/THR ON
  - 5 kt in case of Ice Accretion in CONF FULL
    10 kt in case of Ice Accretion in CONF 3
  - 1/3 Headwind component (excluding gust - maximum 15 kt).

LANDING PERFORMANCE FOLLOWING IN-FLIGHT FAILURE

Ident.: EFB-LDG-50-00022607.0001001 / 28 NOV 19
Applicable to: ALL

LANDING PERFORMANCE ECAM INDICATIONS

After an aircraft system failure that occurs in flight, the flight crew follows the associated ECAM procedure.
When required, the ECAM displays landing performance indications in the applicable procedure.
The ECAM alert items are displayed on the ECAM STATUS page. The ECAM displays LDG DIST PROC APPLY if an ECAM alert item affects landing performance.

LANDING PERFORMANCE CALCULATION

The flight crew enters the ECAM alerts item that affect performance and expected landing conditions in the LDG PERF application to calculate the landing performance.

FLAPS LEVER POSITION

The flight crew selects the FLAPS lever position requested by the ECAM.

Note: *If there are no ECAM instructions, the FLAPS lever position for landing is at flight crew's discretion.*

VAPP DETERMINATION

- **If the ECAM displays LDG DIST PROC APPLY:**
  The flight crew enters into the FMS - PERF - APPR page the VAPP value computed by the LDG PERF application.

ROW ◁ LANDING DISTANCE CROSSCHECK

Ident.: EFB-LDG-50-00022608.0001001 / 28 MAY 20
Applicable to: ALL

The ROW ◁ landing distance may, in some cases, exceed the factored in-flight landing distance.
The flight crew will not be authorized to initiate an approach if a ROW ◁ alert is expected (unless a specific authorization is obtained from the appropriate authority to deactivate the ROW/ROP ◁).
If a ROW ◁ alert is expected, and the flight crew is not authorized to deactivate the ROW/ROP ◁ , the flight crew should request to change the runway, or initiate a diversion.
